CONTRACT LIST (continued from p. 269).

PAINTING AND PLUMBING.

May 17. Edinburgh.—Painter work at new pavilion at Saughton Public Park according to plans and specification, which may be seen at the Public Works Office, where also schedules of quantities may be obtained. The estimates must be sealed, and marked "Tender for Painter Work, Saughton Public Park," and sent to R. Morham, city architect, Public Works Office, City Chambers, Edinburgh, by 10 a.m. on May 17.

May 19. Skipton.—Repairing, painting, &c., of street lanterns during the period from June 1, 1906, to May 31, 1907, for the U.D.C. Specification may be seen and all information obtained on application to John Mallinson, surveyor to the Council, Town Hall, Skipton, and sealed tenders, endorsed "Street Lanterns," are to be sent to him not later than May 19.

May 21. Plymouth.—Painting a ward pavilion at the Borough Hospital. Specifications for the work can be seen at the office of the Medical Officer of Health. Sealed tenders, endorsed "Tender for Painting," to be sent to F. M. Williams, Medical Officer of Health, Health Department, 19, Whimble Street, Plymouth, on or before May 21.

May 22. Belfast.—Supply of plumber's work and materials for the year ending 31st March, 1907, for the Corporation. Forms of tender and particulars may be obtained at the Superintendent of Work's Office, Town Hall Street. Sealed tenders, on official forms only, endorsed "Tenders for Plumber's Work," to be lodged in the Town Clerk's Office before 10 a.m. on May 22.

May 22. Selby and Market Weighton.—Painting the Company's property upon the Selby and Market Weighton Branch, for the North Eastern Railway. Specification may be seen and further information obtained on application to E. Smith, the Company's district engineer, Hull. Sealed tenders, marked "Tender for

Painting Selby and Market Weighton Branch," to be sent to the Secretary, at York, not later than noon on May 22.

May 25. Birmingham.—Cleaning and painting the main corridor of the Workhouse, Western Road. Fair wages clause. Specifications and all information can be obtained on application to the Master, F. C. Mitchell, Workhouse, Western Road, Birmingham. Sealed tenders, endorsed "Tender for Painting Corridor," to be delivered to C. Fletcher, clerk to the Guardians, not later than May 26.

No date. Kendal.—Painting and drescoing the whole of the internal walls, cleaning the roofs, marble tablets on walls and other work, for the Vicar and Churchwardens at Kendal Church. Bills of quantities and other information may be obtained on application to John Hutton, M.R.S.I., architect, Kendal.

ROADS AND CARTAGE.

May 17. Edinburgh.—Work and materials required in constructing new granite tramway at Elm row, continuing present tramway from Montgomery Street to London Road, and in laying compressed asphalt paving on concrete bed at Manor Place and Cowgate. Schedules of quantities may be obtained and specifications seen on application to the City Road Surveyor, City Chambers. Tenders, sealed within the official envelopes supplied, must be lodged with Thomas Hunter, W.S., Town Clerk, City Chambers, by 10 a.m. on May 17.

May 17. London, W.C.—Paving works for the Westminster City Council. Forms of tender, schedule, specification and conditions of contract, can be obtained on application at the Works Department, Westminster City Hall, Charing Cross Road, W.C., between 10 and 4 (Saturdays 10 and 1). Fair wages clause. The contract deeds will be prepared at the expense of the Council, and contractors will be required, together with two sureties, to enter into bonds for the due fulfilment of their contracts, or, in the alternative, to agree to the retention by the Council during the period mentioned in the form of tender of certain moneys. Contractors are prohibited from directly or indirectly canvassing members or officials of the Council in support of their tenders and the tender of any contractor who does so canvass will be rejected. Each tender, on the official form supplied, is to be delivered at the City Hall, in a sealed cover, addressed to the Town Clerk, Westminster City Hall, Charing Cross Road, W.C., and marked "Tender for Paving Works." No tender will be received after 10 a.m. on May 17.

May 18. Manchester.—Execution of the work named in the undermentioned streets and passages:—Sewering, draining, paving, &c., Gill Street, from Wesley Street to Grey Mare Lane, Openshaw; sewerage, draining, paving, &c., Great Southern Street, from the easterly side of Santiago Street to the Withington boundary Moss Side; sewerage, draining, paving, &c., Santiago Street, from the centre of Heald Avenue to Great Southern Street, Moss Side, and Rusholme; draining, paving, &c., Acorn Street, from Moss Lane East to Great Western Street, Moss Side; draining, paving, &c., Peel Avenue, from Santiago Street to a point 454 yards distant in a westerly direction, Moss Side and Rusholme; draining, paving, &c., Cowesby Street, from Alison Street to Claremont Road, Moss Side; draining, paving, &c., Normanby Street, from its northerly end to a point 101 yds. distant in a southerly direction, Moss Side; draining, paving, &c., Salisbury Street, from the easterly side of Fernleaf Street to Normanby Street, Moss Side; sewerage, draining, paving, &c., passage behind Nos. 19 to 33, Kendall Street, 30 to 62, Ryder Street, and adjoining '9, Kendall Street, Bradford, North Manchester; sewerage, draining, paving, &c., passage behind Nos. 49 to 81, Robert Street, 3, Hague Street, 2, Thompson Street, 386 to 412, Oldham Road, and adjoining 398 to 402, Oldham Road, Newton Heath, North Manchester. Forms of tender may be obtained on application to the Paving, &c., Department (Surveyors' Office), and must be returned to the Chief Clerk, Paving, &c., Department, Town Hall, Manchester, before 10 a.m. on May 18.

May 18. Preston.—Levelling, paving, flagging, channelling, &c., Parker Street, from Roebuck Street to No. 41, and Roebuck Street, from Shelley Road to Inkerman Street. Plans, sections and specifications may be seen and schedule of quantities and form of tender obtained at the office of the Borough Surveyor, Town Hall, Preston, to whom sealed tenders, endorsed "Tender for Paving, &c.," must be delivered not later than noon on May 18. Fair wages clause.

May 18. Barnstaple.—Completing the footpaths, roads, &c., at Portland Street, Newport. Plans and specification may be seen at the office of the Borough Surveyor. Tenders, endorsed "Portland Street," will be received at the Town Clerk's Office on or before May 18.

May 19. Hadleigh.—Supply of 170 tons of 2in. broken Guernsey or Alderney granite, to be delivered free at Hadleigh (Suffolk) Railway Station, between June 18 and 30 for the U.D.C. Sealed tenders, endorsed "Tenders for Granite," with sample, to be sent to Charles J. Grimwade, U.D.C. Office, Hadleigh, Suffolk. No form of tender is issued.

May 21. London, N.—Supply and delivery of a 10-ton steam-roller and scarifier for the Islington Borough Council. Form of tender and particulars can be obtained upon application to the borough engineer, J. Patten Barber, at the Town Hall, Upper Street, Islington, N. Sealed tenders, endorsed "Tender for Steam Road-Roller and Scarifier," must be received by W. F. Dewey, town clerk, Town Hall, Upper Street, Islington, N., by May 21.

May 21. Plymouth.—Making-up and completing, under section 150 of the Public Health Act, 1875, the following streets and lanes:—Knighton Road Lane, South, No. 1; Cleveland Road Lane. Tenders are invited for carrying out the works. Plans and specifications, and conditions upon which forms of tender will be granted, may be seen and bills of quantities obtained at the office of James Paton, borough engineer, Municipal Offices, Plymouth, to whom tenders must be delivered not later than 5 p.m. on May 21.

May 21. South Shields.—Lowering of roadway, drainage, re-macadamising, &c., under N.E.R. Bridge, Jarrow Road, in connection with the Jarrow and South Shields Light Railway. General and detail drawings may be seen and a copy of the form of tender, general conditions, specification, quantities, &c., and other information obtained at the office of S. E. Burgess, M.I.C.E., borough engineer and surveyor, Chapter Row. Tenders on forms supplied (to be fully priced out in the schedule and totalled) must be delivered to the Town Clerk, Court Buildings, South Shields, not later than noon on May 21, endorsed "Tender for Road Lowering, Jarrow Road."

May 21. Sheringham.—Making-up of Regis Place, for the U.D.C. The plans and specification may be seen at the office of T. Inglis Goldie, A.R.I.B.A., surveyor to the Council, Railway Road, Sheringham, and bills of quantities obtained on deposit of a cheque of £2 2s. The tenders to be delivered to E. C. Rolfe, clerk to the Council, Church Street Chambers, Sheringham, not later than 3 p.m. on May 21.

May 22. Newport.—Supply of materials or for hauling broken and unbroken stone for the repair of the main roads for the year ending March 31, 1907, for the Monmouthshire County Council. Particulars and schedules may be had on application at the County Council Offices, Newport. Sealed tenders, endorsed "Tenders for Hauling and Supplying Materials for Main Roads," to be sent to William Tanner, county surveyor, County Council Offices, Newport, Mon., on or before May 22.

May 22. London, W.—Supply of machine-broken road stone and stone chippings for the Great Western Railway Co. Conditions of contract and forms of tender (upon which alone tenders will be received) may be obtained on application to G. K. Mills, secy., Paddington Station, London, by whom tenders, marked outside "Tender for Road Stone, &c.," will be received on or before May 22.

May 22. Spennymoor.—Flagging, herbing, channelling, road-making, sewerage, &c., required in the making of Park Avenue, Back Park Avenue and Front Park Crescent, form the U.D.C. Plans, specifications, &c., may be seen and form of tender obtained on application to C. R. Spencer, surveyor to the Council, Silver Street, Spennymoor. Tenders, endorsed "Park Avenue, &c.," to be sent to F. Badcock, clerk to the Council, Council Offices, Spennymoor, not later than 4 p.m. on May 22.

May 23. Barrow-in-Furness.—Flagging or tar paving of the Receiving and Cottage Homes in Rosse Road. Plans and specifications may be inspected at the office of H. T. Fowler, A.R.I.B.A., architect, Cornwalis Street. Tenders to be enclosed in a sealed envelope, marked "Tenders for Paving," and delivered at the Parish Offices, Harrison Street, before 10 a.m. on May 23.

May 24. Cuckfield.—Materials and carting. Supply of about 550 tons of granite broken to 1½ in. gauge, and for 125 yds. of flints, for the U.D.C. To be delivered carriage free at Haywards Heath Station at such times and in such quantities as the Surveyor may direct. Samples of granite and a sample truck of flints containing 4 yds. must be sent to Haywards Heath Station, carriage paid and invoiced to the Surveyor, on or before May 24. Tenders are also invited for carting the above materials from Haywards Heath Station on to the several roads in the district. Tenders, on forms to be obtained from Edward Waugh, clerk, Haywards Heath, must be sent to the latter on or before May 24.

May 28. Guildford.—Construction of a new road, about 100 yds. in length and 40 ft. wide throughout, and inclusive of certain works of sewerage and surface-water drainage. Plans and specification may be seen and forms of tender obtained on application to C. G. Mason, A.M.I.C.E., borough surveyor, Tuns Gate. No tender will be considered upon the prescribed form. Tenders, endorsed "Tender for New Road," are to be sent to F. S. Miller, town clerk, Town Clerk's Office, Bridge Street, Guildford, on or before May 28.

May 23. Witham.—Supply of 500 tons of good granite, uniformly broken to 1½ in. gauge; also for 300 tons of blast furnace slag, uniformly broken to 2 in. gauge, to be delivered in equal quantities weekly, carriage free, at the Witham Station of the Great Eastern Railway during the months of October, November and December. Tenders, endorsed "Tenders for Granite" or "Tenders for Slag," with samples, to be sent to W. Bindon Blood, clerk, District Council Office, Witham, Essex, on or before May 28.

May 23. Burgess Hill.—Supply of 200 yds. of surface dug flints, 650 tons of 1½ in. granite and 40 tons of just granite, for the repair of highways, to be delivered as required by Sept. 29, for the U.D.C. Delivery may be either at Burgess Hill Railway Station or on such of the roads within the district as may be directed by the Surveyor. Persons tendering must state at which place they propose to deliver. Tenders (on forms to be obtained of the Clerk), sealed and endorsed "Tender for Flints" or "Tender for Granite" as the case may be, and accompanied by samples, to be delivered to the Clerk to the Council, Burgess Hill, on or before May 28.

May 23. Mistley.—Paving, metalling, channelling and making-up certain streets at Mistley, for the Tending R.D.C. Specification, bill of quantities and form of tender may be obtained upon application to the surveyor, J. Bell, at Great Bentley. Plan and conditions may be seen at the Surveyor's house any weekday, except Wednesdays, at noon, provided twenty-four hours' notice is given. Sealed tenders, accompanied by priced bills of quantities and endorsed "Tender for Private Street Works," must be sent to A. J. H. Ward, clerk to the Council, 42, Church Street, Harwich, not later than May 28.

May 29. Great Yarmouth.—Supply of the following road materials:—1,400 tons 1½ in. Guernsey granite; 1,400 tons 1½ in. basalt, quartzite, penlee, or other stone of equal value for roadmaking; 1,500 yds. cube broken flint; 500 yds. cube coarse gravel; 1,000 yds. cube fine footpath gravel. Specifications, form of tender, and envelopes in which the tenders must be enclosed, can be obtained at the office of J. W. Cockrill, M.I.C.E., borough surveyor, Town Hall, Great Yarmouth. Tenders are to be delivered

at the office of the Town Clerk, Town Hall, Great Yarmouth, before noon on May 29.

May 29. Aldershot.—Genuine iron slag tar macadam, about 700 tons, more or less, delivered f.o.r. at either of the town stations for the U.D.C. Forms of tender and all particulars may be obtained upon application at the offices of the District Surveyor. Tenders, endorsed "Tar Macadam" to be sent to the clerk, W. E. Foster, on or before May 29.

May 29. London, S.W.—Providing and laying new tar-paving in playgrounds attached to schools, and also for repairing, retopping and running tar-paving at the various schools, &c., under the London County Council. Persons desiring to submit tenders may obtain the specification, form of tender, and other particulars at the Education Offices (Architect's Department), Victoria Embankment, W.C. Tenders must be upon the official forms, and the printed instructions contained therein must be strictly complied with. Fair wages clause. Each tender must be enclosed in the envelope provided, and delivered at the Education Offices (Room 148), Victoria Embankment, W.C., not later than 11 a.m. on May 29.

May 29. Gateshead.—Re-paving Bridge Street and Church Street from the Swing Bridge to High Street, and Chandless Street, from High Street to Elder Street. Plans and specification can be seen and quantities obtained at the office of N. P. Pattinson, borough engineer, Town Hall. Separate tenders are to be sent in sealed and endorsed "Tender for Paving Bridge Street and Church Street" and "Tender for Paving Chandless Street," on or before 2 p.m. on May 29.

May 29. Gateshead.—Paving, &c., the following streets:—(1) Dean Street, (2) Back Beacon Street, (3) Back Derwent Gardens, (4) Myrtle Grove, (5) Back High Street, (6) Fern Dene Road, (7) Back Balmoral Avenue. Plans and specification may be seen and quantities obtained at the office of N. P. Pattinson, borough engineer, Town Hall. Tenders are to be sent in, sealed and endorsed "Tenders for Street Paving," on or before 2 p.m. on May 29.

May 30. Prestwich.—Private street improvement in Egeron Street, Heaton Park, and adjacent streets, and in Knott Lane, Prestwich, and the adjoining side street, within the urban district of Prestwich, subject to general conditions of contract, which can be inspected at the Surveyor's Office, Chester Bank, Prestwich, any morning between 9 and 11. The plans, specifications and quantities of the proposed works will be open for inspection at the office of the Surveyor, Chester Bank, between the hours above-mentioned. Copies of the bills of quantities and any further information that may be required can be obtained from the Surveyor on payment of £2 2s. Tenders must be sent in sealed envelopes, endorsed "Tender for Private Street Works," and must be delivered to Lewis A. Orford, clerk to the Council, Council Offices, Chester Bank, Prestwich, not later than 10 a.m. on May 30.

SANITARY.

May 17. Linton.—Sewerage contract No. 2. For the execution of all work involved by the connection of house drains to the new system of sewerage in the parish of Linton on the basis of a schedule of prices for the Repton R.D.C. Specification and schedule of prices may be obtained at the offices of the engineers, Willcox & Raikes, 63, Temple Row, Birmingham, on payment of a deposit of £2 2s. Sealed tenders, with schedule of prices filled in, in detail, on the form supplied, and endorsed "Linton House Connections," must be delivered at the office of C. F. Chamberlin, clerk to the Council, Union Offices, Burton-on-Trent, not later than 10 a.m. on May 17.

May 17. Mayfield.—Construction of sewerage and sewage disposal works for the village of Mayfield, for the Uckfield R.D.C. The said works include about 5,100 yds. of stoneware sewers from 6 in. to 9 in., all the necessary flushing tanks, ventilation, manholes &c., septic tanks, storm-water overflow disposal and sewer irrigation works, in accordance with plans and specification, which have been prepared by John Taylor, surveyor to the Council. The drawings and specification may be seen at the office of the Surveyor, Henley House, Uckfield, from whom copies of the bills of quantities, schedules of prices, and forms of tender may be obtained on payment of the sum of £2 2s. Sealed tenders, endorsed "Mayfield Sewerage Works," must be delivered at the office of F. Holman, clerk, 86, High Street, Lewes, on or before noon on May 17.

May 21. Dalkey.—Construction of about 340 yds. of a 12 in. sewer at Saval Park Road, for the U.D.C. Plan, specification and conditions of contract can be seen at the Council's Office on any weekday between 10 a.m. and 2 p.m. Tenders, including the names of two solvent sureties, to be under cover and marked "Tenders for Dwellings," must be lodged with J. P. Gahan, clerk of the Council, Town Hall, Dalkey, before noon on May 21.

May 23. Bodmin.—Tunnelling and laying 12 in. iron pipes therein, also stoneware pipes, constructing manholes, and other work, at the Cornwall County Lunatic Asylum, in accordance with plans, specifications and general conditions of contract, which may be seen at the offices of the engineers, S. W. Jenkin & Son, The Parade, Liskeard; or at the Steward's Office at the Cornwall County Lunatic Asylum, Bodmin. Intending contractors will have to deposit the sum of £3 3s. The successful contractor will be required to enter into a contract, and find two sureties in one half the sum of his tender, for the due performance of the contract. Sealed tenders, on printed forms supplied, are to be delivered at the office of M. F. Edyvean, clerk to the Visiting Committee, Bodmin, on or before noon on May 23.

May 24. Romford.—Works of sewerage in the parish of Collier Row, as hereunder, for the Romford U.D.C.:—About 2,978 ft. run of 12 in. foul sewer, Mawneys Road; about 955 ft. run of 6 in. foul sewer, Mawneys Road; about 928 ft. run of 10 in. foul sewer, Elm Road; about 1,426 ft. run of 10 in. foul sewer, White Hart Lane; about 1,090 ft. run of 7 in. foul sewer, Lowshoe Lane; about 30 ft. run of 10 in. foul sewer, Chase Cross Road;

about 1,717 ft. run of 9 in. foul sewer, Chase Cross Road; about 1,473 ft. run of 7 in. foul sewer, Chase Cross Road; about 1,070 ft. run of 10 in. foul sewer, across roads. With all manholes, ventilating columns, inverted syphons, sett paving, junctions, &c., required. Plans may be seen, and specifications, quantities, and forms of tender obtained, on application to H. T. Ridge, Council Offices, Romford, upon payment of £5. Sealed tenders, endorsed "Sewerage Works," must be sent in on the forms supplied, and delivered to Charles T. King, clerk to the Council, Council Offices, Romford, not later than May 24.

May 29. Bath.—Supply and delivery of glazed stoneware socket pipes for the period from 1st June, 1906, to 30th March, 1907, for the R.D.C., the pipes to be delivered on rail to Bath and in such quantities as may be required from time to time. Specification and form of tender can be obtained on application from R. H. Whittington, clerk to the Council, 5, Old King Street, Bath, to whom tenders, sealed and endorsed "Tender for Stoneware Socket Pipes," are to be delivered by May 29.

No date. London, E.—Drainage works at the workhouse in Bancroft Road, E., for the Mile End Old Town Guardians. Forms of tender and full particulars relating to the work can be had on application at the office of J. M. Knight, architect, 35, Bancroft Road, Mile End, E. Fair wages clause.

TIMBER.

May 30. Dublin.—Supply of 30,000 creosoted rectangular sleepers 8 ft. 11 in. by 10 in. by 5 in. (17,000 to be delivered in July, 1906, and 13,000 in March, 1907), for the Dublin, Wicklow and Wexford Railway Co. Specifications and forms of tender can be had on application to the Secretary. Tenders, marked "Tenders for Sleepers," and addressed to the Secretary, Dublin, Wicklow and Wexford Railway, Westlandrow Station, Dublin, to be forwarded so as to reach him not later than 10 a.m. on May 30.

June 1. Southampton.—Supply of deals and matched boarding, for the Director-General, Ordnance Survey. Applications for forms of tender and specification should be made to the Officer in Charge of Stores, Ordnance Survey Office, Southampton. All tenders must be submitted before noon on June 1.

MISCELLANEOUS.

May 17. Woolwich.—Supply of water-vans, slop-carts, sweeping machines, &c., as follows, for the Borough Council:—Three water-vans, one water-cart, ten slop-carts, two street-sweeping machines and one road scraper. Fair wages clause. Forms of tender and any information required can be obtained at the office of J. Rush Dixon, M.I.C.E., borough engineer, Town Hall, Woolwich. Tenders must be sent in envelope, sealed and endorsed "Tender for —," to Arthur B. Bryceson, town clerk, Town Hall, Woolwich, not later than noon on May 17.

May 19. Walsall.—Supply of the following stores for the Gas Department, during the period of one year from July 1:—Wrought-iron and galvanized tubes and fittings, lamps, iron, lead and compo piping, gasfittings, tin, ironmongery, glass and putty, brushes and oils. Forms of tender and further information may be obtained at the Gas Office, Council House. Tenders, sealed and marked outside "Tender for Gasworks Stores," are to be sent to John R. Cooper, town clerk, Council House, Walsall, on or before May 19, and on or before that day, in the cases specified in the form of tender. Samples of the respective articles, marked with a distinguishing number or letter, are to be sent to the Gas Office, Council House (Lichfield Street entrance). Samples will not be paid for by the Corporation.

May 21. Cheshunt.—Carrying out the following works within the district of the U.D.C.:—Erection of cart-sheds at the depot, Manor House; construction of about 162 yds. run of concrete retaining wall, with gulleys and other works, in Trinity Marsh Lane; supplying and erecting 238 yds. run of 4 ft. 6 in. high unclimbable iron fencing; constructing about 100 yds. run of 15 in. S.W. sewer, with man-holes, &c., at Turner's Hill; constructing about 92 yds. run of 6 in. S.W. sewer, with man-holes, &c., in York Road; laying about 300 yds. super. of tarpaving in Albury Grove Road. The drawings and specification can be inspected and forms of tender and envelopes obtained on application at the office of Reginald H. Jeffes, M.I.C.E., engineer and surveyor, Council Offices, Cheshunt, Herts, during office hours. Sealed tenders, endorsed "Tender for —," as the case may be, and addressed Chairman of the Council, to be delivered at or before 4 p.m. on May 21.

May 22. London, S.W.—Supply of the following articles, for the Secretary of State for India:—Brass boiler tubes, copper firebox plates and laminated bearing springs. The conditions of contract may be obtained on application to the Director-General of Stores, India Office, Whitehall, S.W., and tenders are to be delivered at that office by 2 p.m. on May 22.

May 23. Manchester.—Twelve months' supply of agricultural drain pipes, also twelve bales American oak, forty-five standards spruce deals, two standards red deals, and one standard pine deals. Specifications and particulars may be obtained upon application to Superintendent of the Cleansing Department, Town Hall, Manchester, and must be sent in before 10 a.m. on May 23.

June 7. Penrhybyr.—Supply of the following stores, for the Penrhybyr Navigation Colliery Co., Ltd., Penrhybyr R.S.O., Glam.:—Iron and steel; castings; bolts, nuts, rivets, iron washers and nails; miners' lamps and lamp glasses, electric lamps and fittings; steam, water and gun-metal fittings, &c.; ironmongery, files, saws, gouges, colliers' tools, knives, shovels and sundry stores; paints; brushes, brooms, &c.; pitch-pine deals, red pine, best quality, American birch boards and deals, poplar and elm curbs, elm, G. and T. match and flooring boards; wire ropes; lime and cement; oils. Forms of tender can be obtained on application to the Secretary, to whom tenders must be sent not later than June 7.

Bankruptcies.

[Abbreviations: R.O.—receiving order; P.E.—public examination; C.C.—county court; O.R.—official receiver; Adj.—Adjudication.]

DURING THE WEEK ending May 11th twenty failures in the building and timber trades in England and Wales were gazetted.

C. F. COOK, builder, Catford. R.O. May 1.
J. SHAW, builder, Crawley. Adj. April 30th.
J. W. VAUGHAN, builder, Colwyn. Deficiency £378.
I. TYSON, builder, Egremont. Gross liabilities £599; to rank £570; assets £347.

WHEATLEY & EASTON, builders, Whitkirk & Halton. Liabilities £1,270; assets estimated to produce £2,124.

G. YOUNG & Co., builders, Chiswick. P.E., Brentford Town Hall, June 8th, at 11.

C. STEARN & Co., builders, decorators and plumbers, Ipswich. Adj. May 3rd.

W. DRAKE, builder and contractor, Poulton-ley-Flde. P.E., Preston Sessions Hall, June 15th, at 11.

W. PREECE, senior, house decorator, Ledbury. P.E., Worcester Guildhall, May 22nd, at 2.

T. RHODES, joiner and builder, Macclesfield. R.O. May 2nd.

T. F. FINNEY, builder, Middleton-on-Row. First meeting, O.R.'s, Middlesbrough, May 16th, at 3. P.E., Stockton-on-Tees, May 16th, at 7.30.

J. MAKIN, builder, Belvedere. First meeting, 115, High Street, Rochester, May 21st, at 11.30. P.E., Rochester C.C., same day, at 2.30.

R. J. PARKER, contractor, London, N. First meeting, 14, Bedford Row, W.C., May 17th, at 12. P.E., Edmonton C.C., June 11th, at 11.30.

A. SUCKLING, builder and contractor, Halstead. Gross liabilities £5,679; expected to rank £3,814; assets estimated at £1,327.

Coming Events.

Wednesday, May 16.

ROYAL INSTITUTE OF PUBLIC HEALTH.—Mr. Carl Prausnitz on "The Bacteriology of Water, Milk and Tuberculosis," at 5 p.m.

JUNIOR INSTITUTION OF ENGINEERS.—Joint meeting with Architectural Association (Discussion Section), to continue the discussion on Mr. S. N. Bylander's paper on "Ferro-concrete," at 7.30 p.m.

SURVEYORS' INSTITUTION.—Annual dinner (Juniors), Trocadero Restaurant, at 6.30 p.m.

Thursday, May 17.

ARCHITECTURAL ASSOCIATION.—Annual Dinner, Georgian Hall, Gaiety Restaurant, at 7 p.m.

CHEMICAL SOCIETY.—Ordinary Meeting at 8.30 p.m.

SOCIETY OF ARCHITECTS.—Mr. Arthur Poley on "Some recent Law on Sewers and Drains," at 8 p.m.

WORSHIPFUL COMPANY OF CARPENTERS.—Mr. H. D. Searles-Wood, F.R.I.B.A., on "Timber and Half-timber Houses," at 7.30 p.m.

Saturday, May 19.

EDINBURGH ARCHITECTURAL ASSOCIATION.—Visit to Bonnybridge Foundry, Stirlingshire.

JUNIOR INSTITUTION OF ENGINEERS.—Visit to Hornchurch, Essex, to inspect wharfing constructed in Ferro-concrete. Train leaves Fenchurch Street at 2.40 p.m.

NORTHERN ARCHITECTURAL ASSOCIATION.—Students' Sketching Club Excursion.

Monday, May 21.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.—Mr. Paul Waterhouse on "The London Traffic Commission Report," at 8 p.m.

Tuesday, May 22.

ARCHITECTURAL ASSOCIATION OF IRELAND.—Valedictory Address by the President, at 8 p.m.

WORSHIPFUL COMPANY OF CARPENTERS.—Mr. S. Barter on "Setting-out, Preparing and Fixing Joiners' Work," at 7.30 p.m.

ROYAL INSTITUTE OF PUBLIC HEALTH.—Mr. William R. Smith on "The Law of Public Health," at 5 p.m.

Wednesday, May 23.

ROYAL INSTITUTE OF PUBLIC HEALTH.—Mr. Carl Prausnitz's lecture (continued) at 5 p.m.

Friday, May 25.

ARCHITECTURAL ASSOCIATION.—Second Summer Visit, to Marsh Court, Hampshire.

ROYAL INSTITUTE OF PUBLIC HEALTH.—The Harben lectures at 5 p.m.

Monday, May 28.

SURVEYORS' INSTITUTION.—Annual General Meeting at 3 p.m.

ROYAL INSTITUTE OF PUBLIC HEALTH.—The Harben lectures at 5 p.m.

Wednesday, May 30.

ROYAL INSTITUTE OF PUBLIC HEALTH.—The Harben lectures at 5 p.m.

A COMPLETE SCHEME OF DECORATION.
This illustration shows a complete scheme of decoration carried out with Hall's Distemper. This Distemper overcomes the difficulty of obtaining a uniform tint on plain walls, and is the most easily manipulated material for stencilling friezes, dadoes, panels, etc., where the softness and delicacy of its tints are seen to great advantage.
Stencils for artistic friezes suitable for halls, drawing, dining, billiard rooms, etc., are now obtainable from the manufacturers. Decorators will find these designs, which are specially prepared for Hall's Distemper, a great aid to artistic effect.
Full particulars can be obtained from **SISSONS BROTHERS & Co., Ltd., HULL.** London Office: 199, Boro' High Street, S.E.

A New Idea about Jerry-building.

Mr. G. K. CHESTERTON gives us a new idea about jerry-building. We should not say he knows very much about architecture, certainly not about modern architecture, but the criticism of laymen of ability is always interesting. Mr. Chesterton says that what we lack is not so much any good building as any good thing to build, and to his thinking he finds some consolation in the fact that the suburbs are jerry-built; the point about them is not so much that they are badly built as that they are not worth building well. Mr. Chesterton makes the charge that modern architecture is not modern, and he tells us that whereas if Michael Angelo were suddenly to wake and see a picture by Whistler or Manet he would call it "a new style," and would say the same about a story by Kipling or an opera by Wagner, if he looked upon the Gaiety Theatre or Westminster Cathedral he would exclaim, "Oh, I see you have the same style of architecture." Personally we find a difficulty in embracing the Gaiety Theatre and Westminster Cathedral as part of the same phase of architecture that Michael Angelo knew in his day, but Mr. Chesterton will have it so.

The Everlasting Campanile.

It has been quite refreshing to pass many months with never a word about the campanile of St. Mark's at Venice, but the golden silence has now been broken, immediately upon the removal of the hoarding round the foundations. The old argument about whether the tower should have been rebuilt or not is now dead, and nobody with any sense wants to rake up that matter again, but having decided upon the rebuilding the foundations can no sooner have been completed and a few courses of brickwork erected upon them than the howl begins again. This time it is of a more æsthetic nature than ever. A correspondent from Venice reminds us that, partly through the effects of time, partly through intentional efforts to raise it above the sea level, the pavement of the Piazza San Marco is now more than 2ft. 6ins. higher than it was originally, and consequently the bases of all the buildings are covered to that extent. The Campanile originally had five steps leading to it, while at the time of its fall only two-and-a-half were above ground. The architects of the new tower have copied the original five steps, which will, it is thought, when the Campanile is completed, make the other buildings in the Piazza, especially the Basilica of San Marco, already low, look very squat. Moreover, the offending five steps have been put in the same space occupied before by the two-and-a-half steps, "causing a grotesque and inartistic effect, which is heightened by the finished

and precise blocks of stone used in place of the original rough and irregular slabs. Both tower and piazza suffer immensely, the former because the space used for the steps is too narrow, and it is perched in an incongruous manner above the other buildings, and the latter because the basilica is lowered by comparison in such a way as to be out of all proportion." We should take these remarks with a considerable reservation. In our opinion, matters of this kind are very apt to be exaggerated by people who have not had their way in regard to them. We call to mind many such instances. Opinions about the rebuilding of St. Mark's Campanile are just as diverse now as they were at the time of the collapse, but we trust there is not going to be a persistent chorus of discord as every course of bricks is laid. We shall soon get very tired indeed of that.

Side Issues.

THE recent earthquake and fire at San Francisco has resulted in two rather amusing side issues so far as architects are concerned, which, however, are perhaps not so amusing to the architectural profession in America as they are to us here. It appears that the mayor of San Francisco, while the fire was still burning, telegraphed to the mayors of other cities asking them to provide, as one of our American contemporaries puts it, "not money, nor food, nor mechanics, but architects and architectural draughtsmen! Possibly the architects of the Golden State may think that this was quite needless, and that there is enough home talent to cope with the situation. It is possible, too, that, as the mayor is a union man—belonging to the musicians' union, we believe—and knows that there has been of late some friction between the city authorities and the San Francisco Chapter A.I.A., he may have felt that the architects of the city would actually go on strike in this hour of need, and that he would show wisdom in having strike-breakers on the scene early." The local architects will probably be most annoyed by the second instance of unnecessary interference from the city authorities. The official city architect has been appointed supervising architect of the new municipal buildings that will need to be erected. He will receive as his salary 2 per cent. commission on the cost of the building, and this amount will be deducted from the 5 per cent. which would be paid to the architects of the building. That is to say, they will receive 3 per cent. No wonder the Americans talk of the holding up of private practitioners, for whereas this individual used to receive 4,000 dols. as wages a year, he will apparently now have an annual income of 25,000 dols. to 35,000 dols.

SOME RECENT LAW ON SEWERS AND DRAINS.*

By Arthur P. Poley, Barrister-at-Law.

MY present object is not so much to examine the cases brought under the Public Health Acts, nor to criticize them, but to state results and to tell you what the effect of the recent decisions is, so that you can translate them into practice and, if called upon, to intervene in the interesting arguments that occasionally take place between clients and the local authority as to who is to pay for the repair of the thing—pipe or conduit, or whatever you like to call it for the purpose of avoiding the term "sewer" or "drain."

What is a Drain?

Now, I suppose most people who study the question at all are familiar with section 250 of the Metropolitan Management Act of 1855. It runs: "It is provided that in the construction of the Act the word 'drain' shall mean and include any drain of, and used for the drainage of, one building only, or premises within the same curtilage, and made merely for the purpose of communicating with a cesspool or other like receptacle for drainage, or with a sewer into which the drainage of two or more premises occupied by different persons is conveyed, and shall include any drain for draining any group or block of houses by a combined operation under the order of any vestry or district board (for which we may now read the order of any borough council), and the word 'sewer' shall mean and include sewers and drains of every description except 'drains' to which the word interpreted as aforesaid applies."

Now the drain is to drain one building only or premises within the same curtilage. If it drains more than one building it is a sewer, and if you can say on examination of a system of drainage that the drainage drains two buildings, unless there is an order of a vestry or district board in existence, or something else, which is not an order, but which

Judicial Ingenuity

has said is an order, you may safely say that the so-called drain is a sewer, which the local authority are bound to keep in order.

I call attention to judicial ingenuity, for I imagine anyone who knows anything of what sanitarians set before themselves in 1855 will know that their ideal was one house, one drain; they did not intend that a loose practice should grow up or be sanctioned of combined drainage in respect of new houses, except in special circumstances; if there was to be combined drainage it was to be under proper safeguards, and it was to be made by the order of the vestry or district board.

The Difficulty with Old Houses.

Now there were a number of old houses in existence in 1855 where there was already a system of combined drainage, and in respect of these a case of difficulty arose. They were built before the passing of the Act of 1855, and therefore there could be no order of a vestry or district board in regard to them: hence by the definition of a sewer as one that drained two or more houses these drains were sewers. Therefore the Legislature said it was never intended that the drains of all these houses should be sewers repairable by the vestry or district board; so we will make that clear by an Amendment Act: and accordingly the Act of 1862 was passed, and it declared that the word "drain," in addition to the definition I have already given, should include "any drain for draining a group or block of houses by a combined operation laid or constructed before January 1st, 1856, pursuant to the

order or direction, or with the sanction of the Metropolitan Commissioners of Sewers," who were created under that title in 1848.

The Application.

Therefore, in determining whether a drain draining two or more houses is a sewer, it is material to notice whether the houses were built before 1848. If they were you may be certain that the so-called drain is a sewer. If between 1848 and 1855, if there is no order or direction or evidence of the sanction of the Commissioners, then you may be also certain that the so-called drain is a sewer. If the drain draining two or more buildings came into existence subsequently to 1855 you must not lightly think that there must be an order of a vestry or district board in existence, as the Act in express words says "there may be evidence of an order, which the judges have said is just as good as an order."

How to decide the Point.

I can safely recommend any architect called in to advise on the point as to whether a drain is a sewer or not to examine what the evidence is in the surveyor's office of a metropolitan borough council before he expresses an opinion on the subject as to whether there is an order or not. If there is no note of a surveyor's approval, nor a minute of a vestry or district board, I think we may safely say there is no order, nor is there any evidence of an order, and if the drain drains two or more buildings it is a sewer.

The next point to ask is

What is a Building?

Two houses may constitute one building—a pair of semi-detached villas, in fact; this was so decided in *Humphrey v. Young* in 1903.

Another question that sometimes crops up is whether the premises are in the same curtilage. This is a question which largely depends upon the facts. The last case upon this point was *Harris and Others v. Scourfield* (T.L.R., Vol. 26, p. 268), decided in the latter part of 1904.

Part Sewer and Part Drain.

A practical matter of some difficulty often arises where three or four or more houses are drained by one drain, and by reason of there being no order or evidence of an order in existence the drain is a sewer. The question is as to whether any part of the sewer is a drain or not.

Let me take a case of three adjoining houses, numbered 1, 2 and 3 respectively: 1 draining into 2, and the joint drainage of 1 and 2 passing into 3. Is it a sewer from end to end? No. A pipe receiving the drainage of more than one building not being premises within the same curtilage is a sewer from and below the point where it receives the drainage of more than one such building: above that point it is a drain and not a sewer.

Justice Cave's Definition.

In *Beckenham District Council v. Wood*, 1896, 60 J.P., 490, Mr. Justice Cave said: "The general rule, as I understand it, is that where a drain receives the sewage of two or more houses it is a sewer; where it receives the sewage of one house only it may still remain a drain, though not necessarily, because it may be a sewer whether it takes the sewage of one house only or no house at all. A main sewer may be laid down by the local authority in a new street where no houses are built; but where it is intended houses shall be built subsequently the buildings may be commenced at the lower end of the street, and when the drains of one house are connected with the main sewer the connecting pipes will be drains and not sewers; but the sewer itself will no less continue to be a sewer although it receives only the drainage of that one house, and consequently a sewer without a drain at all will be a sewer."

Unauthorized Connections.

There is another matter to which I should like to allude before passing on to sewers and drains outside the Metropolis, and that is the unauthorized connections which builders sometimes make when the local authorities are careless in their supervision. Now, it would be very unfair that a builder who made such an unauthorized connection should turn round and say, when the drains required repairing: "I know this is an unauthorized connection. I admit I made it, but having made it between these two houses I have made a sewer, and you know it is not my business to repair a sewer." He cannot, however, act in this way, for it is a legal maxim that no one can take advantage of his own wrong, and a builder who made such a statement would be told that he would be stopped from raising such a defence. A late case has carried the principle a little further. *Heaver v. Fulham Borough Council*, 1904, 2 K.B., 383, decided that not only can the builder not raise it, but those to whom he has conveyed the property by voluntary conveyance cannot raise it, nor could the builder's executors or administrators. The best advice that one can give to a builder who has made an illegal connection between houses and, in fact, has constructed a sewer, is to get rid of the property as speedily as possible. A purchaser who buys it will be able to take advantage of the builder's wrong unless he chooses to be too inquisitive and wants to know all about it. As long as he is ignorant he is an innocent purchaser, and this is one of those cases "when ignorance is bliss, 'tis folly to be wise."

Recent Decisions Outside the Metropolis.

I must now turn to the subject of sewers and drains outside the Metropolis, and here it will be found that the recent decisions have been most important. The principal cause of trouble has arisen by reason of section 19 of the Public Health Acts Amendment Act, 1890, which provides that, where two or more houses belonging to different owners are connected with a public sewer by a single private drain, an application may be made under section 41 of the Public Health Act, 1875 (relating to complaints as to nuisances from drains), and the local authority may recover any expenses incurred by them in executing any works under the powers conferred on them by that section from the owners of the houses in such shares and proportions as shall be settled by their surveyor, or (in case of dispute) by a court of summary jurisdiction.

For the purposes of this section the expression "drain" includes a "drain used for the drainage of more than one building."

What a "Private" Drain is.

Now what does "private" mean? Well, it has been decided in *Thompson v. Eccles Corporation*, 1904, 2 K.B., 1, that "private" means a drain constructed on private ground, and private is not used by way of contrast to public, a view which had found acceptance with many of the judges. Therefore, where two or more houses belonging to different owners are connected with a public sewer by a single drain constructed on private ground, the section applies; that is to say, the machinery of the section can be employed to make the owner of that portion of the land through which the private drain which is out of repair runs put it in repair, or the local authority can do the work themselves in default of the owner and charge him with the costs.

Is a Private Drain a Sewer?

I think we can dismiss any idea as to whether the single private drain is a sewer or not. According to the judgment of Lord Russell, C.J., in *Bradford v. The Eastbourne Corporation*, which the Court of Appeal followed in the case of *Thompson v. The Eccles*

* Summary of a paper read before the Society of Architects on Thursday last, May 17th.

Corporation, the private drain is a sewer, and as such vests in the ordinary way in the local authority, but it is divested for the purposes of section 19, and for these purposes only. Now the term "vest" is one with which lawyers are familiar in connection with roads. The surface of a road vests in the local authority, but the soil is the property of the freeholders on each side of the road, and if it should happen that the local authority abandoned the road the surface would revert, or belong once more, to the freeholders. When this is understood it will be seen that the ordinary obligation of repairing a sewer, which, under section 13 of the Public Health Act, 1875, vests in the local authority, is transferred or divested for a special purpose, and as soon as that purpose is fulfilled the single private drain draining houses belonging to different owners reverts in the local authority again.

A Supposition.

Now, supposing that you discover the following state of things: a row of twelve houses belonging to one owner, each of the houses in the row draining at the rear into a pipe or conduit, and at a break in the row houses belonging to different owners, still a continuation of the row, also draining into a pipe or conduit in the rear, and a single private drain running at right angles to these pipes or conduits through the break in the row draining the drainage of all the houses into a public sewer. Is the pipe or conduit at the rear of the twelve houses, which would be a sewer by reason of the definition of a sewer, and not within the exception in section 19 of the Act of 1890, not a sewer because it drains into a single private drain?

The Wimbledon Urban Council in the case of *Jackson v. The Wimbledon Urban Council*, 1905, 2 K.B., 27, raised this contention. They said that since the sewage of all the houses ultimately traversed the single private drain, Mr. Jackson, who was the owner of the twelve houses I have given in the illustration, was liable for the non-repair of his pipe or conduit. The Court of Appeal said no! The place to be repaired could not be brought within the definition of a single private drain merely because sewage which was carried along it passed at some other part of its course through what could be properly called "a single private drain."

A Knotty Point cleared up.

The next case to which I will refer is that of *Joseph v. The Wood Green Urban District Council*, which was decided in August last year. There was a common pipe, which ran on private ground behind a row of sixteen houses. Six of these houses, belonging to the respondent, Joseph, drained into this so-called private drain or pipe, but the houses did not possess single drains, being drained in pairs, the drains of each connecting at the rear and thence running into the common pipe, which discharged into the public sewer. Now after the drains of each pair of houses had connected in the rear, the length of pipe which communicated with the alleged single private drain or pipe was a sewer. So there were six houses draining in pairs by three sewers into the alleged single private drain. Could the alleged single private drain be a single private drain in these circumstances? The Court thought not. They were of opinion that in these cases each house had a separate drain draining into the single private drain, and they decided that the alleged single private drain by reason of these three sewers discharging into it was not a single private drain at all, but a sewer.

Definition of a Sewer.

I should like now to pass from section 19 to refer briefly to some cases which are decided on the words of the definition of sewer and drain in the Public Health Act of

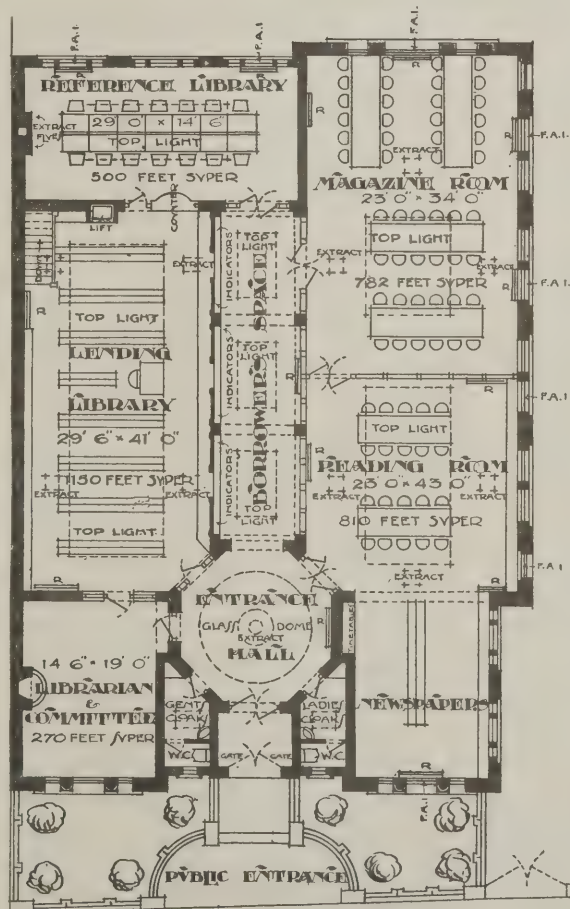

1875. The definition of "drain" is substantially the same as that I have already given in connection with this word under the Metropolis Management Act of 1855, but the word "sewer" includes sewers or drains of every description, except drains to which the word drain, interpreted as aforesaid, applies, and except drains vested in or under the control of any authority having the management of roads and not being a local authority under the Act. In other words, if you have not got a drain within the meaning of the definition of a drain, or a drain vested in or under the control of a road authority, your drain is a sewer, because every drain not within the excepted classes is a sewer. Therefore, if a house drains into a pipe, and the pipe receives the drainage of a field, the pipe from the place of junction is or should

be a drain which, as not coming within the exceptions, is a sewer. A recent case, the *Wincanton Rural District Council v. Parsons*, 1905, 2 K.B., 34, decides the contrary. The case has considerably puzzled me, and, with very great respect to the learned judges who decided it, I doubt its soundness. Nevertheless there it is, and architects called in to advise in respect of country houses where a similar state of things exists will do well to make a note of it.

New London Fire-station.—A new fire-station has been erected in Greycoat Place, Westminster, to take the place of the old station in Francis Street. It has been designed by Mr. W. E. Riley, F.R.I.B.A., superintending architect to the London County Council.

BANGOR LIBRARY.

FFORDD GWYNEDD

BANGOR FREE LIBRARY: FIRST-PREMIATED DESIGN.
A. E. DIXON, A.R.I.B.A., ARCHITECT.

WE illustrate on this page the selected design for the new free library to be erected at Bangor at a cost of £3,000. The architect is Mr. A. E. Dixon, A.R.I.B.A., of Messrs. Dixon & Potter, 65, King Street, Manchester. This design was awarded the first premium of £25 in the competition decided a few weeks ago, Mr. P. C. Thicknesse, F.R.I.B.A., of Liverpool, being the assessor. There is no need to describe the disposition of the rooms, as the plan clearly shows this. For the convenience of the staff a staircase from the lending library communicates with the basement which is arranged at the back of the building, as the ground falls in that direction; a staff and goods entrance are provided at this level, where also are a storeroom of ample size, a heating chamber, and store for coal and coke. It is proposed to carry out the elevation in red bricks with stone dressings and blue Welsh slates on the roof. The interior is intended to be finished with glazed tile dados in the principal rooms, floors of pitch-pine blocks on concrete, and marble and mosaic floors in entrance, vestibule and hall. The building is to be heated by hot water at low pressure, and ventilated by means of fresh-air inlets, ventilating radiators and roof ventilators, assisted by one or two electric fans. Lighting by electricity. We are indebted for the illustrations to the "North Wales Chronicle," of Bangor.

NOTES ON COMPETITIONS.

THERE is a bad epidemic of the non-assessor disease in the North. The past week has produced three cases, two of which are accompanied by complications which render hopes of recovery doubtful, in spite of their having been subjected to the most up-to-date treatment. The first case is that of the

New School at East Wemyss.

This is an open competition for a new elementary school and offices for senior pupils. Clause 2 of the conditions states: "After examining the plans submitted, the Board will forward the most suitable to the Scotch Education Department, whose decision will be final." It was a similar clause to this which led to all the trouble at Colchester, where competitors maintained that the plans selected by the Board were *not* the most suitable. Things go from bad to worse in clause 3, where "The Board does not, however, bind itself to carry out any one of the designs submitted." There are no premiums. Competitors are asked to visit and examine the ground for themselves and at the same time prepare for their own use a block plan of the site. Wemyss is in Scotland.

The second case is of the well-known "Carnegie" type and belongs to a

Proposed Free Library at Annfield Plain.

"Competitors must clearly understand that the committee's decision in the matter of the designs submitted are to be final and conclusive on all matters relating thereto." Thus definitely and ungrammatically commences the assessing clause. An objector has been informed that "it is not intended to call in any special expert assistance" and that "the members of the committee who have the matter in hand include a practical builder, a mining engineer and other practical persons." Truly a most practical committee, as is evidenced by the following clause, which is unique in its way, and worthy of adoption in that much under-assessed class of competition, "Carnegie" Libraries: "The competitors who signify their acceptance of these conditions and submit designs to the committee, by that act agree to accept the decision of the committee in the matter, and no competitor may or shall in any way have any legal cause for complaint or redress at the hands of all or any of the members of the committee for any decision or action on which the committee may by a majority of their number jointly determine." The picture of the committee crouched behind this fence in Annfield Plain, protected from the vituperative missiles of infuriated competitors, is humorous. Designs are to be sent in under motto.

The third case is at Durham, and is that of some

New Schools at Consett.

"The committee will select the plans which, in their judgment, will best meet their needs, and their decision shall be final and binding on all competitors." The effects of this clause are more limited than in the former instances, because competitors are being specially invited by the Education Committee, presumably from the environs of Durham. From information received, it appears that the Durham County Council is an old offender, and that the result of a former competition was anything but satisfactory. There is special need for expert assessing in this instance, for the school is not a small one; the accommodation required is for 1,100 children, at a cost of £10 per head, in addition to 15s. per sq. ft. of superficial area for central halls and science rooms.

In all the above cases representations have been made to the promoters in favour of the appointment of an assessor.

Secondary School, Liverpool.

The Competition Reform Society announces that it has received from the Town Clerk of Liverpool the following reply to its appeal on behalf of the appointment of an assessor in this competition: "I laid your letter of the 11th inst. before the Sites and Building Subcommittee at their meeting yesterday, when they desired me to say that they will appoint a professional assessor." This is satisfactory, and a reward which makes other cases not without hope.

The Peace Palace.

The selected design for the Peace Palace to be erected at the Hague has been pretty well circulated by now, and though it would seem to be highly admired by the public—being referred to, for example, in the "Graphic" as "a splendidly executed conception in the style of the chateaux of Northern France"—we are sure all architects in this country, at least, will marvel that such a hotch-potch should be the result of a competition like this, for which there were more than 200 competitors from all parts of the world. We have not had an opportunity of seeing the plan of the building, but it must indeed be of exceeding merit to cover the sins of the exterior, which exhibits at one and the same time the features of an hotel-de-ville in a second-rate French town and the unrestrained exuberance of a side-show at Earl's Court. Frankly we are amazed that such an atrocious design should have been awarded the first premium. We are glad to note, however, for the sake of this country, that Mr. Colcutt, the English representative on the jury, did not vote for it.

Society of Architects' Travelling Studentship Competition, 1906.

The subject of this competition was a country house costing not more than £3,000. Twenty-seven sets of designs were received from students of the Society, and the council has placed first the design by Mr. Victor H. Grist, of 4, Marlboro' Avenue, Reading, who thus becomes the first holder of the Society's Travelling Studentship, which is of the value of £25 and carries with it the silver medal of the Society. Some of the competitors considerably exceeded the limit of cost and were disqualified on that account, but in view of the number and general merit of the designs submitted the council has allocated a special prize, value £3 3s., placed at its disposal by the president (Mr. Albert E. Pridmore), to Mr. Alan G. Brace, of Sunny Croft, Knowle, Warwickshire. The following designs are specially mentioned:—No. 12, by Mr. Geoffrey Morland, of Croydon; No. 13, by Mr. Sydney G. Scales, of Westcliff-on-Sea; and No. 24, by Robert O. Jackman, of Kingston Hill. A public exhibition of the designs will be held at the Society's premises from May 28th to June 2nd inclusive, from 10 a.m. to 8 p.m., to which admission will be free on presentation of visiting card. Arrangements are also being made for the designs to be exhibited at Plymouth.

Branch Libraries, Sunderland.

The first premium in the competition for branch libraries at Sunderland has been awarded to Mr. Hugh Hedley, and the second premium to Mr. Clayton Green, both local architects.

New Technical Schools for Dublin.

At a recent meeting of the Dublin Municipal Council Alderman Kelly moved the adoption of the report of the Technical Education Committee with regard to the selection of an architect for the proposed new technical schools in Bolton Street, and asking for a suspension of the standing orders with a view to seeking competitive designs for the building from Dublin architects. Alderman Irwin said if they were to adopt this report it would mean the payment of £2,000 by way of a fee to an architect. Surely their own city architect should be entrusted with

the work, to be carried out in conjunction with the expert adviser of the Technical Education Committee. The Lord Mayor advised that the resolution and report should be allowed to stand over. They were already committed to the city architect. A question arose as to whether the standing orders were to be suspended to consider the resolution, and ultimately the Lord Mayor ruled the motion out of order, in accordance with the opinion of the law agent.

Competitions Open.

The following is a list of competitions open:—

DATE OF DELIVERY.	COMPETITION.
May 31	CHAPEL AND SCHOOLROOM AT MANSELTON, SWANSEA. Particulars from Mr. T. Roberts, 71, Brynhyfryd, Swansea.
June 26	NURSING AND CONVALESCENT HOME AT GLOSSOP, to cost £6,000. Premiums of £20 and £10. Particulars from Mr. T. W. Ellison, town clerk, Norfolk Chambers, Glossop.
" 30	ELEMENTARY SCHOOL AT EAST WEMYSS. Particulars from Mr. A. Watson Taylor, clerk to the School Board, East Wemyss, R.S.O., Fifeshire.
July 2	SECONDARY SCHOOL FOR GIRLS AT AIGBURTH VALE, for the City of Liverpool Education Committee. Limited to architects in Lancashire and Cheshire. Particulars from the Town Clerk, Municipal Offices, Liverpool.
" 4	SCHEME OF SEWERAGE AND SEWAGE-DISPOSAL WORKS AT WARBLINGTON. Premiums of £100 and £50. Particulars from Mr. J. W. Loader Cooper, clerk to the U.D.C., Queen Street, Emsworth.
Oct. 31	BOURSE AT CAIRO.—Premiums of £250 and £100. International competition. Designs to be submitted to the "Corporation des Agents de Change," Cairo, Egypt.
No date	DETACHED AND SEMI-DETACHED HOUSES AT CLIFTONVILLE, BELFAST.—Premiums £700. Particulars from R. J. McConnell & Co., 51, Royal Avenue, Belfast.

Obituary.

Mr. H. F. Froggatt, district surveyor for Hereford, died recently, aged 76.

Mr. G. C. Cornwall, one of the largest Government contractors in the Colonies, died recently in London, in his eighty-sixth year.

Mr. Thomas Wright, of Catford, died on May 11th, aged 84. For thirty-five years he was clerk of the works at Westminster Abbey, of which building he had a wonderful knowledge.

Mr. William Parrott, builder, of Chester, died recently in his eighty-first year. He had been in business in Chester for sixty years, and carried out some very important contracts.

Mr. Edward Salomons, F.R.I.B.A., the well-known Manchester architect, died on May 12th in his seventy-ninth year. A native of London Mr. Salomons had lived in Manchester since he was six years old, and had practised there as an architect since 1852. He was the architect for the Arts Treasures Exhibition at Old Trafford in 1887, and he also designed the Savings Bank in Booth Street, the Reform Club in King Street, the bank at the opposite corner of King Street and Brown Street, and the Prince's Theatre, besides warehouses in Peter Street, Portland Street, and other parts of the city. He was much sought after as an architect of large residences, and executed commissions of the kind in Cheshire and more distant parts of the country, as well as at Biarritz, Brussels, Amsterdam and other places on the Continent. Mr. Salomons' chief pastime was painting in oils and water colours. He was a founder of the Manchester Academy of Fine Arts and one of the founders of the Manchester Society of Architects, of which he was twice elected president.

A.A. MEMBERS' DINNER.

THE annual members' dinner of the Architectural Association was held on Thursday evening last at the Gaiety Restaurant, when about 140 guests were present, including Mr. E. Guy Dawber, F.R.I.B.A., the retiring president (who occupied the chair), Mr. R. S. Balfour (the new president), Sir Henry Tanner, Mr. Edwin T. Hall, Mr. Basil Champneys, Mr. H. T. Hare, Mr. J. Douglass Mathews, &c. After the Royal toast had been given, Mr. Arthur Keen proposed the toast of the R.I.B.A., to which Mr. Edwin T. Hall responded. Mr. Ryan-Tenison proposed "The Architectural Association," and Mr. Dawber, in replying, thanked the secretaries for the assistance they had rendered him during his year of office. He also referred with satisfaction to the reduction of the building debt, which was now practically wiped off. Mr. Walter Cave toasted "The Guests," for whom Professor Hulme responded.

THE PURPLE PATCH.

THE fourth spasm of "The Tufton Street Tatler, or The Purple Patch," is out upon us. We are getting to regard this effort of the wits of the Architectural Association with quite a tender affection, as, judging by the fund of ideas which our own pages afford the editors, its very being would seem to be bound up with our own; if we ourselves went in for a spasm and suddenly stopped publication it would go hard with the local convulsion at Westminster; meanwhile, we would remind our irregular and irresponsible contemporary (which, by the way, has had to raise its price from 6d. to 1s.) that accuracy is looked for even in its own pages, and that amateur editors are not exempted from spelling properly. Our own title is incorrectly given on p. 71, "Burnett" for "Burnet" on p. 73, "Caroe" for "Caröe" in several places, "J. O. Matthews" for "J. D. Mathews" and "F. T. Baggally" for "F. T. Baggallay" on p. 74, "Brunaleschi" for "Brunelleschi" on p. 86, &c. The number, however, is a good one. The next spasm will take place at the conversazione in November.

IN PARLIAMENT.

(By our Press Gallery Representative.)

The Perennial Question of Ventilation.

IN the Commons last week Mr. Dillon brought up again the question of the ventilation of the House, which, he complained, was still unsatisfactory.

Mr. Harcourt, replying, said that during the Easter recess he had had an exhaust tank placed on the roof of the Division Lobby which could extract 45,000 cub. ft. out of the Lobby in one minute. Enquiries by Dr. Haldane and Dr. Gordon into the ventilation of the House had not ceased, and an interesting bacteriological report on the experiments made would shortly be published. What was wanted was air large in volume but low in velocity. A velocity of about $1\frac{1}{2}$ ft. per second practically was not felt by anyone, and only very sensitive people felt a velocity of $2\frac{1}{2}$ ft. per second. Above that rate there was draught.

It was reckoned that the quantity of air requisite for a human being to enjoy good health was 50 cub. ft. per minute. The maximum accommodation of the chamber and its galleries was 900, and it was therefore necessary to drive through the chamber 45,000 cub. ft. of air per minute. The new input fans which were installed last year were worked at 47,000 cub. ft., the maximum speed being 58,000 cub. ft. The output fan had a similar exhaust capacity. He could change the air of the House without discomfort to members in four or five minutes.

Law Cases.

Workmen's Compensation.—In the King's Bench Division last week Mrs. E. G. Ward, of Shepherd's Bush, brought an action, on behalf of herself and her two children, to recover damages from Mr. T. L. Green, builder and contractor, on the ground that the death of her husband was due to the negligence of the defendant's servants. Early in 1904 defendant was building a new wing at the Boundary Road School, Camberwell, and plaintiff's husband was employed by Messrs. Pearson, who had contracted with defendant to supply and fix the necessary heating apparatus. Owing to a portion of the flooring of the third storey giving way, plaintiff's husband was precipitated to the ground. A radiator fell on him, and he received injuries from which he died. The jury found a verdict for the plaintiff and awarded £500 damages, £320 for the widow, £120 for the youngest son, and £60 for the elder son. The case had twice previously been tried, and on each occasion the jury had failed to agree.

R.I.B.A.

London Traffic Commission Report.

A MEETING of the Royal Institute of British Architects was held at No. 9, Conduit Street, on Monday evening, Sir John Taylor, K.C.B., vice-president, in the chair.

The death of Mr. Edward Salomons, elected an Associate in 1851 and a Fellow in 1860, was announced.

Mr. Paul Waterhouse, M.A., then read a paper on the London Traffic Commission Report. He dwelt chiefly on the proposal of the Commission that the traffic congestion of London should be relieved by certain alterations of existing streets, and notably by the construction of two new thoroughfares, one traversing the Metropolis from north to south, the other linking Bayswater with Whitechapel.

West-to-East Avenue.

Dealing with the west-to-east avenue, which it was proposed to strike north-eastward from Hyde Park at a point adjoining Victoria Gate, forming at that point a continuation of the Bayswater Road, which it was intended to widen all the way from Shepherd's Bush Station, Mr. Waterhouse pointed out the undesirable oblique junction of two important thoroughfares which would take place, and showed how by a slight deviation it could be overcome. In the case of Connaught Street, he recommended the destruction of both sides, so that Hyde Park Square might indicate the axis of the first straight length. Coming to the junction of Regent Street and Portland Place, he proposed the removal of Queen's Hall and the formation of a circular roadway round All Souls' Church.

As an alternative route, Mr. Waterhouse suggested that after passing through East Marylebone the avenue could glide between the churches of St. Andrew and All Saints, and cross Berners Street so nearly at right angles as to offer no undue disregard to the frontage of Middlesex Hospital. He also proposed that at certain points in the route new open spaces should be formed. The suggested route would lead through Russell Square and run parallel past the Foundling Hospital. The plunge through the Finsbury district, cutting through Finsbury Pavement House and the site of the displaced Roman Catholic church, involved the destruction of a mass of very costly new buildings and the mutilation of an attrac-

tive formation of frontage—the curve of Finsbury Circus—which seemed likely to result in a very heavy expenditure, not sufficiently balanced by compensating advantages. He further suggested that the proposed avenue, instead of passing along the south of Liverpool and Broad Street Stations, should cross the rails at a point north of the station buildings, where a road bridge already exists.

North-to-South Avenue.

As regards the north and south avenue, he suggested an entire change. Assuming that the Temple Pier was the point at or near which a new bridge was wanted, why not strike a nearly straight line for a magnificent street running from the great entrance of the Law Courts to the dome of Bethlehem Hospital? This street would, of course, be treated as regards level in the same way as Waterloo Bridge Road. That is to say, it would not descend to the level of the Embankment, but, retaining the high level secured at the Fleet Street or Strand end, it would pass over the Embankment Road, and would only descend on the south side of the river to pass under the railway lines near Waterloo Junction Station. The south end was sufficiently near the Elephant (the southern haven of the Commissioners), and the junction with the Strand was an approximation to the eastern horn of Aldwych. From Aldwych northward the avenue was ready made to Theobald's Road, and thence the bargain already effected between the London County Council and the Duke of Bedford for the widening of Southampton Row seemed to suggest that the avenue should take that line to Russell Square, where the two great avenues were to intersect.

North of Russell Square the line of route would continue along Woburn Place effecting the widening on the left-hand side so as to avoid injury to St. Pancras Church, and taking beyond the Euston Road the track of Seymour Street.

The lecturer claimed for his new route that it performed its purpose with more dignity, at less cost, and with far fuller efficiency than the Holloway-to-Elephant route of the Commissioners.

Architectural Design.

As regards the question of architectural design in the streets themselves, he deprecated any insistence upon uniformity of design on a large scale, referring to the failure of recent attempts to dispose of valuable frontage sites under conditions which barred the free exercise of personal architectural wishes and commercial requirements. Individualism in street architecture in London was by no means unsuccessful. He assumed, however, that if his or a similar scheme were eventually adopted certain points would be selected as demanding homogeneous and continuous design. If the proposed Traffic Board were appointed, it must certainly have as one of its chief duties the safeguarding and promoting of a concrete and definite plan of street improvement, and to do this he suggested the appointment of an architectural adviser to the Board. The architectural advisers should not himself design any portion of the new streets, unless in the matter of bare plan. For each building centre demanding continuous treatment a separate architect should be appointed; and on no consideration whatever should individual licence on the part of lessees or purchasers be allowed to prevail within the boundaries of such prescribed portions. Finally, on all parts of the new frontages perfect liberty of design and choice of architect should be allowed, subject to the control of the Board's architectural assessor or assessors, who should have absolute powers of censorship over all designs submitted.

Sir Melville Beachcroft proposed a vote of thanks, which Sir George Bartley seconded.

THE EFFECT OF FIRE ON BUILDING STONES.

A VERY interesting and valuable paper on this subject was read by Mr. W. R. Baldwin-Wiseman, M.Sc., before last week's meeting of the Surveyors' Institution. It set forth the results of a series of experiments made with the object of estimating the ultimate stability of a building after being subjected to a severe fire, by determining first the transverse and crushing strength of stone (a) when thoroughly dried, (b) when soaked in water, and (c) when made hot, and then either slowly cooled in air or suddenly plunged into cold water; and, secondly, determining the expansion of stone under heat, and its permanent alteration on subsequent cooling. In these experiments Mr. Baldwin-Wiseman was assisted by Mr. O. W. Griffiths, B.Sc., A.R.C.S., with whom he is now collaborating in another research on the physical properties of concrete and reinforced concrete.

In all, 24 classes of stone were experimented upon, 6 being sandstones, 9 limestones and calcareous freestones, 6 marbles, and 3 of igneous origin.

Sandstones.	Limestones.	Marbles.	Granite.
York.	Portland.	Carrara.	Red Peter-
Red Mansfield.	Monk's Park.	Rouge Royal.	head.
Aspatia.	Box Ground.	St. Anne's.	Grey Aber-
Quartzite.	Bradford.	Dove.	deen.
Daresbury	Bath.	Black.	Diabase.
(hard & soft).	Hopton Wood.	"Belgium	
Doubling.	Two chalks.	granite."	

How the Tests were Carried Out.

All the test pieces were dressed to strips 6 ins. by 1 in. by 1 in., excepting the marbles, which were 6 ins. by $\frac{3}{4}$ in. by $\frac{3}{4}$ in., the red granites 6 ins. by 1 in. by $\frac{3}{4}$ in., and the quartzites 6 ins. by $1\frac{1}{4}$ ins. by $1\frac{1}{4}$ ins. The marbles and granites were also polished on one face.

The heating of the stones was done in an electric furnace.

For the cross-breaking experiments the test piece rested on two thin pieces of rubber sheeting laid upon two rigid steel knife edges exactly 4 ins. apart; the test piece carried at its centre a steel saddle $\frac{3}{8}$ in. wide, rounded on the underside with a curve of large radius and terminating below in a hook, carrying a scale pan on which the load was placed in increments of 5 lbs. at a time. In the compression tests the test pieces were dressed to cubes of 1 in. side, and finished with smooth faces. These blocks were placed between two sheets of lead, 3 ins. by 3 ins. by $\frac{1}{8}$ in., to equalise the pressure, and crushed between the plates of an Olsen hand-fed triple-lever testing machine.

Results.

Considering first those experiments for determining the strength of the stone, many of the Doubling, Portland and Bradford test-pieces emitted a peculiar crackling noise during the first five minutes after insertion in and removal from the furnace. The York stone changed in colour from a straw yellow to a terra-cotta red, the diabase from a dark greenish-black to a dirty yellowish-green; while the Monk's Park, Portland, Hopton Wood and Box Ground stones became chalky in appearance and somewhat lighter in colour. The Aspatia test-pieces gave off a dense smoky cloud, which soon after flashed and burnt steadily for about a minute. Several stones, such as Doubling, disintegrated in the furnace or immediately after removal therefrom; while others disintegrated immediately on immersion in or removal from the water. Some, such as Doubling, Carrara marble, the red and (in a less degree) the grey granite, the Bradford and Bath oolites, and the Daresbury sandstone had but little cohesion, and crumbled to powder when touched or when more or less coarsely rubbed with the hand. Several Carrara marbles warped upon cooling, arching slightly; others, such as Hopton Wood,

Monk's Park and Box Ground stones retained a sharp arris, but the sides caved in, and cracks more or less deep developed at right angles to the direction of greatest length of the test piece.

SANDSTONES.

York.

As the results of these tests it was found that York stone, which has a crushing strength of 550 tons per sq. ft., and a transverse strength of 70 tons per sq. ft., or a strength only $\frac{1}{8}$ th of that in compression, deteriorates after subjection to high temperature, so that its resistance to crushing is only 36 per cent. of its original crushing strength when slowly cooled in air, or 40 per cent. when suddenly cooled in water, whilst its transverse strength is only 65 per cent. and 27 per cent. respectively, of its initial transverse strength when slow and fast cooled, so that if a fairly high factor of safety has been chosen in the original design a structure built of this stone may yet be serviceable, with certain safeguards, after a serious conflagration.

Red Mansfield.

Red Mansfield stone has a crushing strength of 160 tons per sq. ft. and a transverse strength of 40 tons, or a transverse strength only $\frac{1}{4}$ of that in compression; its crushing strength after subjection to a high temperature and the two modes of cooling is 100 per cent. and 87 per cent. respectively, whilst in cross-breaking the strengths for the corresponding conditions of cooling are 62 per cent. and 60 per cent., so that, although the deterioration in resistance to cross-breaking is material, it is not of such magnitude as to seriously impair the utility of a well-designed edifice; still less is this the case in regard to compressive stresses.

Aspatia.

The Aspatia stone is somewhat similar to Red Mansfield, in that its resistance to crushing and transverse stresses is 160 and 30 tons respectively, a ratio of 5 to 1, and the post-conflagration crushing strengths are 100 per cent. and 99 per cent. respectively, but it differs from Red Mansfield in that there is a more marked depreciation in its resistance to transverse stresses, to 20 per cent. and 15 per cent. respectively, so that if this material has to withstand crushing stresses only, its deterioration may in ordinary circumstances be negligible, but its depreciation in transverse strength so material as to necessitate grave consideration in the matter of its replacement.

Quartzite.

Quartzite, which has the moderately high crushing strength of 240 tons per sq. ft., and the phenomenally high transverse stress of 130 tons (more than twice the transverse strength of York and five times that of Aspatia), has a ratio of crushing to transverse stress of 8 to 5. It depreciates in compressive strength to 71 per cent. in both cases of slow and fast cooling from high temperature and in transverse stress to 89 per cent. and 93 per cent. respectively. The comparatively moderate diminution of its strength in compression and cross-breaking makes it a valuable stone, and as it is of a good colour and appearance, especially when polished, it should command an extensive market, not only for building purposes but also as road metal, for which its hardness and the cleanliness of its surface especially commend it.

Daresbury.

The soft Daresbury sandstone, with but little natural cementing material, has the comparatively low crushing and transverse strengths of 60 tons and 10 tons per sq. ft. respectively, a ratio of 6 to 1. Its resistance to crushing after both modes of cooling was practically nothing, as was likewise its resistance to transverse stresses when fast cooled; when slowly cooled, however, its

resistance to transverse stresses was about 48 per cent. of its original strength. As this soft stone is but rarely, if ever, used in building, it is not necessary to consider it further.

The hard Daresbury sandstone, being more coherent, offers a greater resistance to crushing and cross breaking, the breaking stresses being 130 tons and 20 tons per sq. ft. respectively, a ratio of 6 to 1; but after subjection to high temperatures its resistance to crushing, when cooled in any manner, is so trivial as to be negligible; so also is its resistance to transverse stresses when fast cooled. When slow cooled, however, its transverse strength is 21 per cent. of the maximum, so that, although initially twice as strong as the soft Daresbury sandstone, its depreciation of strength is twice as great, and both break under practically the same load; or in other words, the heat has the effect of entirely breaking down the efficiency of the cementing material on which its greater initial strength depended.

Doubling Stone.

Doubling stone, which has a crushing strength of 80 tons and a transverse strength of 20 tons per sq. ft., a ratio of 4 to 1, offers little or no resistance to crushing after subjection to high temperatures, for in most cases it fell into an incoherent mass of shelly fragments and sand in the furnace, or whilst cooling, or soon after placing on the table of the crushing machine. Under transverse loads its resistance fell to 2 per cent. and 7 per cent. respectively of its maximum strength, so that at a moderately high temperature it has no fire-resistance value whatever.

LIMESTONES.

Portland.

Portland base bed stone has a crushing strength of 260 tons, and a transverse strength of 90 tons per sq. ft., a ratio of 3 to 1. This subsequently depreciates after subjection to high temperature to 60 per cent., and 51 per cent. in crushing strength, and to 66 per cent. and 14 per cent. in transverse strength respectively, when slow and fast cooled, so that the local action of water in suddenly cooling the stone materially depreciates its strength under both conditions of loading.

Monk's Park.

Monk's Park stone, with a compressive strength of 100 tons and a transverse strength of 40 tons per sq. ft., a ratio of 10 to 4, depreciates in compression to 82 per cent. and 74 per cent. respectively, and in transverse strength to 43 per cent. and 37 per cent., so that, in sustaining crushing loads, it might within certain limits be trusted after a conflagration to perform its office, but could not be trusted to sustain any severe transverse stresses.

Box Ground.

Box Ground stone, with crushing and transverse strengths of 60 and 30 tons per sq. ft. respectively, a ratio of 2 to 1, depreciates in compression to 49 per cent. and 54 per cent. of its original strength, when slow and fast cooled, and depreciates in transverse strength to 2 per cent. and 24 per cent. respectively; so that, whilst it might with due precautions, serve again in compression, it could not be trusted to bear any transverse loads whatever.

Bradford.

Bradford stone, with crushing and transverse strengths of 60 tons and 30 tons per sq. ft., a ratio of 2 to 1, deteriorates so that its strength, after subjection to high temperature, is 50 per cent. and 40 per cent. of its initial compressive strength, and 34 per cent. and 23 per cent. of its initial transverse strength.

Bath.

Bath stone, with slightly greater resistances to crushing and transverse stresses of 70 tons and 40 tons per sq. ft. respectively, a ratio of 7 to 4, deteriorates similarly to 51 per cent.

and 45 per cent. in compression, and to 35 per cent. and 26 per cent. in transverse loading. The depreciation in strength of both the two previous stones is so great as to render them untrustworthy after subjection to a severe conflagration.

Hopton Wood.

Hopton Wood stone, with crushing and transverse strengths of 190 tons and 60 tons per sq. ft. respectively, a ratio of 3 to 1, depreciates in compression to 57 per cent. and 39 per cent. respectively, and when transversely loaded to 39 per cent. and 29 per cent.

Chalks.

The chalks, with their low initial strengths of 20 tons and 10 tons per sq. ft. respectively, had no residual strength whatever, after subjection to the high temperature, the expansion set up by the high temperature in all probability serving only to rupture the walls of the pores and break up the material.

MARBLES.

Carrara.

Carrara marble, with initial compressive and transverse strengths of 290 tons per sq. ft. and 50 tons per sq. ft., a ratio of 6 to 1, depreciates to 55 per cent. and 66 per cent., and to 19 per cent. and 9 per cent. of the respective strengths, when heated and cooled in the two prescribed modes.

Rouge Royal.

Rouge Royal marble with compressive and transverse strengths of 410 tons per sq. ft. and 120 tons per sq. ft. respectively, deteriorates to 55 per cent. of its initial compressive strength when cooled in either way, and to 33 per cent. and 24 per cent. of its transverse strength when slow and fast cooled.

St. Anne's.

St. Anne's marble, with compressive and transverse strengths of 590 tons and 140 tons per sq. ft. respectively, a ratio of 4 to 1, depreciates to 38 per cent. and 45 per cent. in compression, and to 34 per cent. and 27 per cent. in transverse strength; this stone is remarkable in that it depreciates in an almost identical ratio in both strengths when slowly cooled.

Dove.

Dove marble, with a compressive strength of 380 tons per sq. ft., and a transverse strength of 140 tons per sq. ft., a ratio of almost 3 to 1, depreciates in ratios somewhat similar to those for Carrara marble; its compressive strength diminishing to 50 per cent. and 41 per cent. respectively, and its transverse strength to 8 per cent. and 15 per cent. according to the two modes of cooling.

Black.

The black marble, with an initial resistance to crushing of 430 tons, and to transverse loads of 190 tons per sq. ft., a ratio of 2 to 1, depreciates in crushing strength to 61 per cent. and 70 per cent., and in transverse strength to 59 per cent. and 14 per cent. This marble and the Portland stone exhibit the most marked depreciation of resistance to transverse loads when suddenly cooled from a high temperature, and to a lesser extent the Belgian granite displays similar qualities.

Belgian Granite.

The Belgian granite, which has a considerable vogue owing to its uniformity of texture and its comparative cheapness, has a compressive strength of 350 tons per sq. ft. and a transverse strength of 130 tons per sq. ft., a ratio of about 3 to 1; it depreciates to 59 per cent. and 69 per cent. in compression, and to 46 per cent. and 22 per cent. respectively when transversely loaded.

GRANITES.

Red Peterhead.

This, with initial crushing and transverse strengths of 350 tons and 90 tons per sq. ft. respectively, a ratio of 4 to 1, depreciates to 8 per cent. and 6 per cent. in crushing strength and to 10 per cent. and 6 per cent. when

transversely loaded; at once indicating the absolute inutility of granite as a fire-resisting medium; comparable only in its utter depreciation with the poorer sandstones and calcareous freestones.

Grey Aberdeen.

The grey granite with slightly higher initial crushing and transverse strengths of 380 tons and 170 tons per sq. ft. respectively, a ratio of about 2 to 1, depreciates to 33 per cent. and 51 per cent. in crushing strength and to 11 per cent. and $\frac{1}{2}$ per cent. in transverse strength, so that this stone, although it greatly deteriorates, does not so utterly fail in compression as the red; doubtless owing to the somewhat smaller and more uniform size of its component crystals, giving rise to less internal disturbance during expansion and contraction; and it should be noted that, as with York stone, Box Ground, St. Anne's marble, Black marble and the Belgian granite, the crushing strength is slightly increased when suddenly cooled, compared with that when slowly cooled, doubtless because the sudden cooling at the surface gives rise to an intimately interlocked skin; but the grey granite fails more absolutely under transverse loads than does the red, owing to its smaller sized grains.

Diabase.

The diabase with compressive and transverse strengths of 300 tons and 120 tons per sq. ft. respectively, a ratio of 3 to 1, depreciates to 86 per cent. and 50 per cent. of its initial crushing strength, and to 24 per cent. and 5 per cent. of its initial transverse strength, when slow and fast cooled, so that it might within limits be trusted in compression after subjection to the high temperature of a conflagration, but could not be at all trusted under transverse loads.

EXPANSION.

The tests for expansion showed that the sandstones as a class have the greatest co-efficients of expansion in the first range of temperature from 20 degs. C. to 100 degs. C., the co-efficients varying from 9 millionths for Aspatia, to 16 millionths for Quartzite; in the higher or second range of temperature, from 100 degs. to 200 degs. C., there is an increase of the co-efficient to 1.5 times that at the lower range in the case of the Red Mansfield as the greatest rate of increase, and 1.1 times that at the lower range for the hard Daresbury as the least variable. In the highest or third range of temperature, from 200 degs. C. to 300 degs. C., there is a greater variation in the rate of change of the co-efficient than in the two previous ranges, the co-efficient for the Red Mansfield being 1.9 times that in the first range, whilst that for the Aspatia and the Quartzite remain practically constant at the value for the second range.

In general, the sandstones exhibit least variation in their rate of change at the higher temperatures, but the initial mean co-efficient of expansion in the lowest range is so high that the uniformity is more apparent than real.

The oolites exhibit a most marked diversity at all temperatures, the Doulting stone having the greatest co-efficients of expansion, in all three ranges, the values being 22.4, 26.2 and 26.7 millionths respectively.

The Bradford stone has the least co-efficient in the first range, the co-efficient being only 2.5 millionths, which is the least value in the co-efficient of all the stones upon which experiments were conducted: the Monk's Park, Box Ground, Portland and Bath stones having similarly low co-efficients of 3, 4, 5 and 5 millionths respectively. But with increase of temperature the diversity is most marked, the co-efficient of expansion from 100 degs. C. to 200 degs. C., considered as a ratio of that at the lower range, varying from 1.2 for the Doulting stone to 4.0 for the Bradford stone, with values of 1.6, 2.3, 2.3 and 2.5 respectively for the Portland,

Monk's Park, Box Ground and Bath stones; in the still higher range from 200 degs. C. to 300 degs. C. the co-efficient remains practically the same for the Doulting stone, but increases to 5.4 times the co-efficient in the first range for the Bradford stone, with intermediate ratios of 2.9, 3.5, 3.8 and 4.6 respectively for the Portland, Bath, Monk's Park and Box Ground stones.

In the case of the marbles, the greatest co-efficient of expansion, for the lowest range of temperature, from 20 degs. C. to 100 degs. C., is 9.2 millionths for Dove, and the least 4.4 millionths for St. Anne's; in the next range, from 100 degs. C. to 200 degs. C., the extreme ratios of the co-efficients to those in the lower range are 3.7 for St. Anne's and 1.8 for Hopton Wood; and in the higher range, from 200 degs. C. to 300 degs. C., the extreme ratios are similarly 4.1 and 2.1 times that of the lowest range, for St. Anne's and Dove respectively.

The igneous rocks in general possess co-efficients similar to those of the sandstones, the co-efficients being 10.2 millionths and 9.7 millionths respectively for the red granite and diabase, but with increase of temperature there is a material increase in the rate of expansion; the red granite having co-efficients of 17.0 millionths and 21.6 millionths in the higher ranges from 100 degs. C. to 200 degs. C., and from 200 degs. C. to 300 degs. C., the ratios being 1.0 to 1.7 and 2.1 respectively in the three ranges of temperature; whilst the diabase has co-efficients of 1.5 millionths and 1.6 millionths at the two higher ranges, giving corresponding ratios of 1.0, 1.5 and 1.6 respectively in the three ranges.

CONCLUSIONS.

It will be seen that stones which have almost identical co-efficients of expansion in one range of temperature have widely varying co-efficients in another, so that if two such stones are bonded together in a structure, and subjected to any considerable range of temperature, the varying expansion at identical temperatures will give rise, not only to severe molecular stresses within the material of the stone, but will also induce a disturbance in the distribution of the external stresses in the structure.

Furthermore, for example, Aspatia, Dove marble, red granite and diabase have co-efficients of expansion in the first range of temperature from 20 degs. C. to 100 degs. C. not greatly differing from those for iron, steel, &c.; but in the higher ranges of temperature there is a great diversity; so that in a combination of, say, granite and steel, as in the modern skeleton steel framework structure, with masonry exterior, most severe stresses must be set up during a fire by the variable expansion of the metal and stone alone, irrespective of the heat distortion of the unprotected ironwork, giving rise to a depreciation of the strength of the stone in addition to that produced by heat alone.

From these considerations it will be at once apparent that, although the incorporation of dissimilar stones in the fabric of an edifice may, by their contrast in colour and texture, materially contribute to the artistic and architectural effects, such a miscellaneous assemblage is not to be recommended from a fire-resistance point of view, and in a less degree this heterogeneity is not in the strictest sense advisable, bearing in mind that the diurnal and annual variations of temperature are not inconsiderable even in these climates.

Also, in designing for fire resistance, no masonry whatever should be carried on the upper boom of a plate girder, for not only are the molecular stresses set up by the variable expansion of metal and stone injurious, but the increased deflection of the beam, under increase of temperature, induces a settlement of the masonry above it and brings additional lateral stresses upon the masonry.

Enquiries Answered.

The querist's name and address must always be given, not necessarily for publication.

Gunter's Lines.

RUGBY.—A. H. A. writes: "Kindly explain or say where an explanation can be found of Gunter's lines on a 3 ft. rule."

The 3 ft. rule is probably a form of Gunter's rule including all kinds of scales, such as scales of chords, tangents, sines, &c. The scales to be found upon such rules are altogether too numerous to explain in these columns, but an explanation will be found in most books upon mathematical instruments. A book entitled "Mathematical Instruments and How to use them," by F. E. Hulme, F.L.S., F.S.A., and published by Kegan Paul, Trench, Trübner & Co., Paternoster House, Charing Cross Road, is particularly clear in its description of these scales. If this or some similar book does not contain all the information required we will further advise you if you will send us either the rule or accurate drawings of it.

Cottages for Farm Labourers.

CAMBRIDGE.—FEN-IAN writes: "I am proposing to erect a (bungalow) cottage for a farm labourer in the fen; to construct it of studwork set on a dwarf brick sill, covered on the outside with creosoted f.e. boards and inside with matchboarding, the roof to be of corrugated iron over felt. Kindly advise me as to (1) the material to fill in between the inside and outside covering of the studs; (2) a satisfactory substitute for any of the materials or method of construction proposed, e.g., Ruberoid for roof; (3) any special method of building the only heavy portion of the cottage, i.e., the chimneys, having regard to the foundation. I need hardly say that cost must be kept down to the lowest point possible."

(1) Clean dry wheat "hulls" or barley or oat chaff rammed in tightly is the cheapest thing I am acquainted with; it will be found quite satisfactory for the purpose.

(2) The only suggestion I make is that you should first board the roof (with unplanned boards), then batten it to carry the corrugated iron, and omit the felt. The air enclosed between the roof boards and the ceiling (which latter I should form of grooved and tongued boarding) will keep the house warm enough, and there will be an absence of the dry-rot which felt so often produces in roofs. (3) A very usual method of construction in fen districts is to build the heavy portion of such a building on the top of the ground (without excavation), because that is the only sound portion of the earth. You should spread the weight over as much surface as possible. I have found crossed planks or wattled hurdles useful in such a case.

F. S. I.

Bolton Abbey: Vaulting.

BOLTON.—H. W. H. writes: "Please name a book or set of plates, similar to Bowman & Crowther's, containing drawings of the Perpendicular west front of Bolton Abbey; also a book with illustrations on vaulting suitable for the R.I.B.A. testimonies of study."

There do not appear to be any plates of Bolton Abbey similar to those by Bowman & Crowther. A good plan of the Abbey with a key to the dates of its various parts and a fine perspective of the west front by Mr. J. A. Slater were published in the "Builder" of May 4th, 1895. The most useful book with illustrations suitable for your practical masonry sheet of testimonies of study is "Practical Masonry," by W. R. Purchase, published by Crosby, Lockwood & Son, 7, Stationers' Hall Court, Ludgate Hill, 1904, 7s. 6d. Other books worth referring to are the following:—"Stereotomy," by French & Ives; "Examples of Groined Vaults," by J. Battye; "Gothic

Architecture," by Bond; "History and Development of Vaulting in England," by E. W. M. Wonnacott; "Construction of Vaults," by R. Willis; "Gothic History and Development," by G. H. West; "Vaults and Vaulting," by C. Babcock and T. H. Eagle; "Vaults and Bridges," by S. Ware; "King's College Chapel," by C. Fowler and F. Mackenzie; "Misure delle volte volte et oblique," by P. Lucci; "Architecture des Voutes," by F. Derart; "Banstine," by I. C. Von Lassanex; and "Geometry," by Sparton. Some of these will be found in any architectural library, and all will be found at the library of the R.I.B.A.

H. Y. M.

The Albert Hall.

A. C. F. writes: "Who designed the Albert Hall? What is the interior diameter of the building, taken at the spring of the cupola, and what is the height of the interior, taken from the pavement to the summit of the aperture or border of the interior of the cupola? When was the building completed?"

The Albert Hall was originally designed by Captain Fowke, who, dying, was succeeded by Major-General H. Y. D. Scott, C.B., as architect. The latter considerably altered the original scheme of the former. The roof was designed by Mr. R. M. Ordish. The frieze of monochrome inlay representing the triumphs of Art and Science was designed by the Academicians, H. W. Pickersgill, Armitage, Marks and Poynter. The work done by each of the above artists will be found fully explained in a paper read before the R.I.B.A. by Major-General Scott on Monday, January 22nd, 1872, and printed in the "Transactions" of the Institute. The building is an ellipse on plan, the total length being 266ft. from outer wall to outer wall, and the total breadth 232ft. Drawings or descriptions giving details of the dimensions required do not appear to have been published. The building was completed in May, 1871.

S.K. EXAMINATIONS IN BUILDING CONSTRUCTION.—STAGE I.

[Not more than seven questions to be answered. The value attached to each question is shown in brackets. Time of examination, four hours.]

THESE answers are not intended to be exhaustive. It is attempted to suggest to students the mode of answering. The examiner does not ask the questions in order to be enlightened by the student on the subject of building construction: he wants to know how much the student knows of the subject, and the student should exhibit this with the least possible trouble to the examiner. Answers should be as concise as possible.

*1. Make a neat tracing in ink of the drawing given, with the writing: the lines should be firm and solid and should finish accurately at the proper points. (15)

THEATRE OF MARCELLUS.

Soffit of Cornice.

[Note.—This drawing fairly tests the candidate's experience with a drawing-pen: the exact stopping of lines at the points of meeting, uniformity of thickness, and ink sufficiently thick and black. It would be easy to criticize the drawing—for example, the triangles surrounding the square are not equal, that at the left lower corner being noticeably larger than the others; however, the candidate has nothing to do with this; his business is to accurately trace lines which will exactly cover lines on the drawing.]

2. Describe fully what you know of blue lias lime, its origin, manufacture, preparation and the precautions to be taken in its use. (12)

Lias is the name of a geological division of rocks. The limestone from lias strata in England is found, when burnt, to produce a more or less "hydraulic" lime. The unburnt stone is of a dark-blue colour; hence the name blue lias. It has been worked at Lyme Regis in Dorset, Watchet in Somerset, at Rugby, Barrow-on-Soar and Whitby. Lias limestone is carbonate of calcium with an irregular proportion of clay included in it. It should be ground after burning, like Portland cement. The blue lias limestone after being quarried is broken like road metal; it is then burnt in a suitable kiln—Hoffmann for preference; then ground fine in a mill and afterwards made up in bags for distribution. If the lime is put into work too fresh after applying water to it, the action of slaking continues after the wall is built, with the result that the work is disturbed and broken: if kept too long before using, its value as a hydraulic lime is diminished. (Hydraulic limes, compared with rich limes, are slow in slaking.)

This is a somewhat long answer; perhaps a shorter one would get full marks.

3. What are the essential properties of a good brick? Distinguish between the following bricks, and state for what purpose they are chiefly used: Fletton, gault, red rubber, blue Staffordshire. (12)

A good brick should be strong to resist crushing, it should take good hold in the wall, successfully resist the disintegrating powers of frost and weather, and be of proper shape and proportions. Portland cement should adhere well to it: faces which show in work should be smooth and true. (These qualities assume that the clay from which the brick is made is suitable, that it has been properly worked, and that the brick has been properly burnt.) A good brick from a heap of bricks having a common origin has kept its shape, is small in size, uniform in colour and easily picked out by its appearance; when taken up in pairs the pair of bricks should be struck together.)

"Fletton," a cheap brick suitable for internal work, not uniform in colour nor well suited for facing bricks.

"Gault," a heavy hard white brick made from the clay known to geologists as gault, at Burnham, Aylesford, Hitchin, &c.; good for any kind of strong work in walls.

"Red rubber," a soft red brick suitable for cutting and rubbing to special shapes; not a strong brick, but homogeneous and of uniform colour throughout.

"Blue Staffordshire," made from clays in Staffordshire which contain iron; a hard heavy dark blue-black brick, very durable, used for paving, channels, coping, &c., and for any kind of heavy and strong brickwork, sheeting of bridges, &c.

[Note.—"Fletton" is not to be found in most of the text-books. As the name of a place it is not found in the Encyclopædia Britannica. It is the name of a parish near Peterborough. The bricks are made from clays which are geologically very recent; they are known in London as "Flitters." An elementary student should be let off lightly if he failed to answer "Fletton."]

4. Show by a sketch on your squared paper how a pole should be slung by a rope for lifting vertically. (12)

It is advisable usually to keep the centre of gravity of the pole well below the point of attachment of the rope.

5. What is the size of a countess slate? Describe clearly and fully what is meant by "lap" and "gauge" in a slated roof, and illustrate your answer by sketches. (14)

20 ins. by 10 ins. The "lap" in slates nailed near the centre is the distance between the tail of any course and the head of the course next but one below it. In slates nailed near the head it is the distance between the tail of any course and the nail-hole of the next course but one below it. The "gauge" is half the difference between the length of the slates and the lap ("length" in head-nailed slates being the distance between the nail-hole and the tail), or gauge = $\frac{\text{length} - \text{lap}}{2}$

in slates nailed near the centre, and
total length (inches) — 1 — lap (inches)
2

in slates nailed near the head. "Gauge," in other words, is the depth of the "margin." Laths are spaced to the gauge, centre to

centre. The sketches show slating nailed near the centre.

6. Draw to a scale of $\frac{1}{12}$ (1 in. to a foot) the plans of two consecutive courses of a square $3\frac{1}{2}$ -brick pier in Flemish bond: the joints may be shown by single lines. (14)

ALTERNATIVE PLANS.

A.

B.

Of the alternative plans shown, "A" is the better bonded and stronger pier; there is also less waste in cutting.

7. You have the choice of the following stones in building a mansion with stables attached: state in what parts you would use them, giving your reasons: Granite, Whinstone, Hard York, Craigleith, Portland Whitted, Box Ground, Hopton Wood, Derbyshire marble. (14)

Granite.—Polished columns, plinths, &c., for outside. A good silicious granite stands the weather well as a polished stone. Granite is good for heavy walling, but is not used for fine carving owing to the expense of cutting it. Good for setts for stable and yard; when of the right kind it does not wear too smooth.

Whinstone.—Not usually polished; rubble foundations; may be used for pavements, but does not hammer-dress so easily and regularly as granite; not so obviously crystalline as granite.

Hard York.—A sandstone; dressings, rubbed ashlar, landings, sills, &c. A good building stone fairly easily worked with mallet and chisel.

Craigleith.—A silicious bound sandstone. A very excellent building stone for nearly every purpose, except very fine carving. Dressings, landings, steps, sills, &c.

Portland Whitted.—Best Portland; comparatively easily worked; good for carving; stands the weather well. Capitals, hood-moulds, arches, piers, columns, &c.

Box Ground.—Similar to Portland, also an oolite (Bath stone), used for same purposes as Portland; a softer, coarser stone, but a good stone.

Hopton Wood.—Shelly limestone; good for steps and ornamental purposes, mantel-pieces, &c.; polishes and retains polish indoors.

Derbyshire Marble.—Somewhat similar to Hopton Wood, but richer and better entitled

to be called marble. Mantels, staircases, &c., dados, stone balusters, &c.

8. Sketch full size on your squared paper a vertical section through the junction of two 3in. round cast-iron rainwater pipes, and describe the method of jointing. (14)

Very frequently rainwater pipes, called by Scotch plumbers "conductors," are "jointed" without any cementing material. If they are used as ventilators to drains the joints should be made close. "Rust joint" is made by filling the space between spigot and socket with iron filings and sal ammoniac.

A leaded joint with gaskin and lead set requires a stronger socket than is usual for rainwater pipes. The joint may be filled with glazier's putty or white lead (and red lead). It is well in case of any kind of filling to put a light yarning indicated at A on the sketch.

9. A York stone sill is described as "7ins. by 4½ins. rubbed, weathered, and throated." Draw to a scale of ½ (1½ins. to a foot) a cross-section of this sill, and describe in their proper order the operations of the mason in preparing it. (14)

Alternative sections shown. A sill 4½ins. deep does not course with ordinary brick-work, though it would course with the 2½in. Ruabon bricks.

Operations in Dressing.—First take one bed out of twist or "wind" by chisel drafts, sighting by parallel lath, punching off to a rough level, and dressing with "boaster" between the drafts made. Gauge thickness and dress the other bed in similar manner, doing least work necessary in the case of the top bed, where to be weathered. Mark off width of nose and line along top bed for top of weather, dress weather, throat and groove, finish seatings, joint, and rub smooth the exposed surfaces with rubbing tool.

10. If lead weighs 710 lbs. per cub. ft., what is the thickness of 6 lb. sheet lead? What weight lead should be used for flats, dormer cheeks, flashings, hips and valleys, soil pipes? (12)

Lead weighing 710 lbs. per sq. ft. might be called 710 lb. lead, and 710 lb. lead is 12ins. thick. 710 lbs. : 6 lbs. :: 12ins. : 10ins. 72 = 101.

On flats lead has to be strong to bear frequent walking upon and to bear the pull of expansion and contraction. On the other places lighter (thinner) lead is sufficient. For flats, 6 lbs. to 8 lbs.; dormer cheeks, 5 lbs. to 6 lbs.; flashings, 3 lbs. to 5 lbs. (depending upon width, aspect, &c.); hips, 5 lbs. to 7 lbs. ("secret" flashings to hips, 3 lbs. to 4 lbs.); valleys, 6 lbs. to 8 lbs.; soil pipes, 10 lbs. to 16 lbs.

11. A window opening 3ft. wide is spanned by a wooden lintel 4ins. deep with 6ins. bearing at each end. Draw to a scale of 1/12 (1in. to a foot) an elevation of the opening and the lintel with a segmental discharging arch over it in two half-brick rings. (12)

12. A compound girder is composed of a 12in. by 5in. rolled steel joist with a gin. by ½in. steel plate top and bottom. Sketch on your squared paper one-quarter full-size (3ins. to a foot) a section through this girder: the rivets need not be shown. (15)

NEW LONDON BUILDINGS.

AT yesterday's meeting of the London County Council the Building Act Committee reported the following applications under the London Building Act, 1894, their recommendations as to consent or refusal being appended in *italics* :—

Buildings on the southern side of High Street, Clapham, to abut also upon Aristotle Road and Cato Road, on the application of J. Donkin, on behalf of the trustees of the Foster Estate. (Consent.)

Retention of a show case in front of No. 340, King Street West, Hammersmith, on the application of G. H. Vardell. (Consent.)

Projecting clock in front of Griffin & Son's premises, Kemble Street, Holborn, on the application of J. J. Griffin & Son, Ltd. (Consent.)

Retention of a wooden oriel window at No. 3, Holland Lane, Kensington, abutting upon Holland Park Road, on the application of J. A. Minty, on behalf of W. T. Lord. (Consent.)

Projecting porches over the doorways of Nos. 32 & 34, Oakcroft Road, Lewisham, on the application of Kennard Brothers. (Consent.)

Projecting porch in front of No. 16, Oakcroft Road, Lewisham, on the application of Kennard Brothers. (Consent.)

The Glasgow Technical College Architectural Craftsmen's Society now has a membership of 127.

The Scheme for a Great Marine Station at Dover has now been decided upon. The Admiralty Pier, having been considerably lengthened, is to be increased in width to the extent of 215ft., and a section about the same area as the Charing Cross terminus is to be covered by an iron and glass roof so as to form a vast marine station, the most extensive of the kind in the world. Work is to be commenced as soon as the Royal assent has been given to the unopposed Bill in Parliament this session, and it is hoped to complete the station in less than three years.

Complete List of Contracts Open.

WITH a few exceptions, news of Contracts Open are not repeated after they have been published once in these columns, so that readers will find particulars in our previous issues of other contracts that still remain open.

Unless expressly stated to the contrary all deposits required for bills of quantities, &c., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair-wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

May 24. Invercharron.—Mason, carpenter, slater, plumber and plaster-works of renovations to the steading, and a servant's cottage, on the farm of Culrain. Plans and specifications can be seen with A. Maitland & Sons, architects, Tain, and offers to be lodged with them on or before May 24.

The plans may be seen and bills of quantities obtained at the office of the County architect, Henry Littler, 16, Ribblesdale Place, Preston, by payment of a deposit of £2. Tenders must be delivered before noon on May 30, sealed and endorsed, to W. Aspinall, Rockleigh, Ashton-in-Makerfield.

May 31. Truro.—Erection of new stores, &c., on the site of the old smelting works, Trafalgar Square, Truro, for W. G. Goodfellow, according to plans and specifications, which may be seen at the office of A. J. Cornelius, M.S.A., architect, Truro. Sealed endorsed tenders to be sent to W. G. Goodfellow, The Parade, Truro, on or before May 31.

May 31. Mountain Ash.—Erection of buildings to be used in connection with the Workmen's Institute, Mountain Ash, for the Committee. Plans, &c., may be seen at our Offices, 1, Jeffrey Street, Mountain Ash, or 42, Canon Street, Aberdare. Endorsed tenders to be sent to Morgan & Elford, not later than May 31.

May 31. Sudbury.—Erection of additional accommodation, consisting of nurses' bedrooms, isolation ward, &c., at St. Leonard's Hospital. Drawings, specification and conditions may be seen at the office of the architect, Alfred Howard, Cornard Road, Sudbury, from whom further information can be obtained. Tenders, which are to be sent in by May 31, should be sealed and endorsed "Tender for Additional Accommodation at St. Leonard's Hospital," and addressed to Joseph Alexander, Esq., secretary of the St. Leonard's Hospital, Sudbury.

June 1. Port Patrick.—Erection of a dwelling-house at Port Patrick, in the county of Wigtown. Copies of the bill of quantities will be supplied on application to the Superintendent Engineer, H.M. Naval Establishment, Kossyth, Inverkeithing, N.B. The drawings, specifications and conditions of contract may also be seen there, and at Port Patrick Coastguard Station and the Office of the Director of Works Department, Admiralty, at which latter place tenders are to be deposited before noon on June 1.

May 25. Huddersfield.—Construction of engine foundations at the Power Station, Longroyd Bridge. Plans, specifications and general conditions may be seen, and bills of quantities and forms of tender obtained, on application at the offices of K. F. Campbell, M.I.C.E., borough engineer and surveyor, 1, Peel Street. Sealed tenders, endorsed "Tender for Engine Foundations," signed in the handwriting of the tenderer or his agent, and addressed "Town Clerk, Town Hall, Huddersfield," must reach him not later than 10 a.m. on May 25.

May 25. Edinburgh.—Asphalte roofing proposed to be executed at the new police and fire station at Saunders Street, Stockbridge, according to plans and specification which may be seen at the Public Works Office, where also schedules of quantities may be obtained. The estimates must be sent, sealed and marked "Tender for Asphalte Roofing, Saunders Street Police and Fire Station," to R. Morham, city architect, Public Works Office, City Chambers, Edinburgh, by 10 a.m. on May 26.

May 29. Underbarrow.—Rebuilding the Middle Road Bridge over the River Pool in Underbarrow. Plans and specifications for the work may be seen on application to James Willison, Tullithwaite Hall, and tenders must be sent to Alfred Leeming, the drainage superintendent, Brigsteer, on or before May 29.

May 31. Bristol.—Erection of Wesley Memorial church, Bryant's Hill, Bristol. Plans, &c., may be seen any weekday from 9.30 a.m. to 4.30 p.m., on application to G. Peters, Kingscote House, Bryant's Hill, St. George, Bristol. Quantities obtained of W. Huggill Dinsley, architect, Chorley, Lancs., on deposit of 10s. 6d. Tenders to be delivered to the Rev. W. J. Clarke, Elmira Villa, Hanham, near Bristol, not later than noon on May 31.

June 1. Leeds.—Erection of a woollen mill adjoining Dewsbury Road, Beeston, Leeds, for W. Douglas Persons, desirous of tendering for the various works required should send in their names to T. A. Buttery & S. B. Birds, 1, Basinghall Square, Leeds. Plans and specifications may be seen and quantities obtained on and after May 25. Sealed and endorsed tenders to be sent to T. A. Buttery and S. B. Birds, 1, Basinghall Square, Leeds, before 4 p.m. on June 1.

June 2. Arnside.—Erection of a residence at Arnside, for W. F. Bolton. Plans and specifications may be seen and particulars obtained at the office of G. L. Hoggarth, architect, Kendal and Arnside, to whom tenders are to be sent by June 2. Preference will be given to the contractors who can commence and complete the work in the shortest time.

June 2. Priddy.—Alterations and additions to the Council school, Priddy, during the summer holidays. Drawings and specifications are at the offices of Price & Jane, Weston-super-Mare. Sealed tenders must reach the County Education Office, Weston-super-Mare, before noon on June 2.

June 2. Leigh.—School. The Corporation of Leigh invite builders desirous of tendering for the erection of a new school in Windermere Road to send in their names to the architects, J. C. Prestwich & Son, Bradshaw Gate Chambers, Leigh. The drawings, general conditions and specification may be inspected, and the bill of quantities with the form of tender annexed, obtained at the offices of the Architects on deposit of £1. Tenders on the form provided, addressed to the Chairman, School Buildings Committee, Town Hall, Leigh, and endorsed "Tender for Council School," must be sent to Stanley Wilson, town clerk, Town Hall, Leigh, before noon on June 2.

June 4. Kinloss and Findhorn.—Mason, carpenter, slater, plumber, plasterer and painter works of alterations and additions at the schools of Kinloss and Findhorn. Plans and specifications may be seen with Peter Fulton, architect and surveyor, North of Scotland Bank Buildings, Forres, who will receive tenders up to 10 a.m. on June 4.

June 4. Ludlow.—Extension of the Infirmary at the Union Workhouse, and for the execution of works of drainage at the same workhouse. For plans and specifications apply to B. Weale, architect, East Hamlet, Ludlow. Separate tenders for each of the works must be sent in to Arthur W. Weyman, clerk to the Guardians, Ludlow, on or before June 4.

June 4. Durham.—Improvements to Middleston Moor School. Plans, specification and conditions of contract may be seen and forms of tender obtained at the School or the Architect's Office. Sealed endorsed tenders to be delivered to W. Rushworth, F.R.I.B.A., architect, County Education Offices, Shire Hall, Durham, on or before June 4.

June 4. Taunton.—For the following works in accordance with the specifications, &c., prepared by the borough surveyor:—Erection and putting up of a mortuary and post-mortem room at the Coal Orchard Yard; paving (with bricks), curbing and channelling of one side of Leslie Street, Rowbarton; painting, &c. of the outside woodwork and ironwork at Lambrook Farm. Plans, specifications and other particulars can be obtained at the Borough Surveyor's Office during the usual office hours, on depositing £1 1s. Tenders, on the prescribed form only, must be addressed, in sealed envelopes, to the Town Clerk on or before June 4, and endorsed on the outside "Tender for —."

June 4. Croydon.—Erection of small first-floor additions to the workshops at the workhouse, Queen's Road, Croydon. The plans, specification and conditions of contract may be seen, and bills of quantities with form of tender obtained at the office of Henry Berney, architect, 104, George Street, Croydon, surveyor to the Guardians, upon depositing the sum of £3 3s. Tenders, sealed and marked "Tender for Additions to Workshops," to be addressed to Harry List, clerk to the Guardians, Union Offices, Mayday Road, Thornton Heath, Surrey, and delivered by June 4.

June 5. Caerphilly.—Erection of thirty or more cottages near Penyrheol, Caerphilly, for the Bargoed and Abertridwr Building Club. Plans and specifications can be seen at the office of P. Vivian Jones, P.A.S.I., architect and surveyor, Hengoed. Endorsed tenders to be sent in to David Phillips, Hanbury Hotel, Bargoed, on or before June 5.

June 5. Mortlake.—Alterations, additions and repairs to be carried out at the Technical Institute (formerly known as Worple House), North Worple Way, Mortlake, for the Barnes U.D.C. Plans and specifications can be inspected at the Surveyor's Office, the Council House, High Street, Mortlake. Tenders for the work must be sent, endorsed "Alterations to Technical Institute," so as to be received by W. T. Goodale, secy. to the Committee, the Council House, High Street, Mortlake, before noon on June 5.

June 6. Huddersfield.—Conversion of buildings at Birkby into schools, &c.; additions to Outlane council school. Plans, specifications and general conditions may be seen, and bills of quantities and forms of tender obtained, on application at the offices of K. F. Campbell, M.I.C.E., borough engineer and surveyor, 1, Peel Street. Sealed tenders, endorsed "Tender for Conversion of Buildings," or as the case may be, signed in the handwriting of the tenderer or his agent, and addressed "Town Clerk, Town Hall, Huddersfield," must reach him not later than 10 a.m. on June 6.

June 9. Snodland.—Building a mortuary at the cemetery, for the Parish Council. Plans and specification can be seen at the office of S. Hilder, clerk, Pelham House, Snodland, to whom tenders endorsed "Tender for Mortuary" must be returned by June 9.

June 9. Dunblane.—Mason, iron, oiner, plumber, slater, plaster, painter and glazier work for the erection and completion of the Queen Victoria School and Memorial to Scottish Sailors and Soldiers, houses connected therewith and offices; also for drainage, fencing and laying-out of ground; and for roads, sewers, water and gas supplies, and relative works. The relative schedules may be had on application to the architect, J. A. Campbell, 124, St. Vincent Street, Glasgow, where the plans and drawings, specifications and measurements will be exhibited and explained. Printed copies of the conditions of contract, specifications and measurements and general conditions will be supplied to intending offerors on a deposit of £2. The schedules shall be priced and extended, but it is intended to accept a lump sum from one offeror for the whole work. No offers for separate works will be entertained by the Executive Council, but contractors will be allowed to sub-contract with the approval of the Building Committee. The schedules and tender must be sent in a sealed envelope, which will be supplied to intending offerors, and addressed to "The Executive Council, Queen Victoria School, care of R. Addison Smith, Esq., honorary treasurer, 19, Heriot Row, Edinburgh," not later than June 9.

June 11. Little Heath.—Erection and completion of a new elementary school and teachers' residence. Persons desirous of tendering for the work may see the drawings, specification, agreement, &c., at the County Surveyor's Office, Hatfield, on and after May 28 between 10 and 4, except on Saturday, when they will be on view from 10 to 12 noon. A copy of the schedule of works and prices (quantities) and form of tender can be obtained at the County Surveyor's Office upon payment of £2 2s. Sealed tenders, endorsed "Tender for School and Teachers' Residence, Little Heath," must be delivered to Urban A. Smith, county surveyor, County Surveyor's Office, Hatfield, not later than 5 p.m. on June 11.

June 12. London, S.W.—Erection of a storehouse for boats at Battersea Park, S.W., for the London County Council. Persons desiring to submit tenders may inspect the drawings, and obtain the specification, bills of quantities, form of tender, and other particulars at the Architect's Department, 15, Pall Mall East, S.W., upon payment to the Cashier of the Council, at the County Hall, Spring Gardens, of £1. Tenders must be upon the official forms, and the printed instructions contained therein must be strictly complied with. Fair wages clause. Each tender is to be delivered at the County Hall, in a sealed cover, addressed to the Clerk of the London County Council, Spring Gardens, S.W., and marked "Tender for the erection of a Boat-house at Battersea Park." No tender will be received after 10 a.m. on June 12. Any tender which does not comply with the printed instructions for tender may be rejected.

No date. Hatfield.—New laundry. Persons wishing to submit tenders for the erection of a new laundry at the Union Workhouse, Hatfield, may send their names to Charles Smith & Son, architects, Reading, together with a deposit of £1 1s., when bills of quantities and other information will be supplied.

No date. Bradford.—Villas. Tenders required for the joiner's, plumber's, plasterer's and slater's work necessary in the erection of a pair of semi-detached villas, Bolton Road, Bradford. Contractors willing to tender must apply for quantities to J. Young & Co., architects, 62, Market Street, Bradford.

No date. North Wingfield.—Erection of four cottages. Builders wishing to tender may obtain quantities and see plans and specifications by applying to T. S. Wilcockson, architect and surveyor, Knifesmith Gate, Chesterfield.

No date. Hereford.—Additions to the Sanitary Laundry, Ledbury Road, Hereford. For particulars apply in writing to W. W. Robinson, architect, 10, King Street, Hereford.

No date. Bowness.—Walling, joiner's, and plasterer's work in the erection of four cottages on the Craig Estate, Bowness, for T. Russell. Plans and specifications may be seen at the office of Joseph Pattinson, architect, Bowness.

No date. Skelton.—200 yds. of brick-wall for burial ground. Particulars to be obtained from Rev. A. Fisher, Skelton Rectory.

ENGINEERING.

May 24. Hull.—Heating by high-pressure system of the school building proposed to be erected in Selby Street West. Blue prints of plans, conditions, &c. (which must be returned together with other particulars) can be obtained at the City Architect's Office, Town Hall. Tenders with schemes, sealed and endorsed "Heating Selby Street West School," are to be addressed to the Chairman of the Finance and General Purposes (Education) Sub-Committee, and delivered at the Town Clerk's Office, Hull, before 10 a.m. on May 24.

May 23. Chertsey.—Heating apparatus for Congregational church, Chertsey. Sealed tenders to be sent by noon on May 23 to Mr. Bartholomew, Holly Bank.

May 23. Dublin.—Supply of sub-station switchboards and accessories, transformer pillars. Specifications, with general conditions and form of tender, can be obtained from the City Electrical Engineer, Fleet Street, Dublin, on payment of £1 1s. for each specification. Tenders, addressed "Chairman of the Lighting Committee, 3, Cork Hill, Dublin," and marked "Tender for Sub-station Switchboards, Transform Pillars, &c.," to be delivered not later than May 28.

May 29. Birkenhead.—Supply, delivering and erection of the undermentioned plant:—Specification No. 31. —Booster-balancer and extensions to switchboard. Specification No. 32. —Travelling-crane. Copies of the specifications, with forms of tender and general conditions of contract, can be obtained at the office of the borough electrical engineer, William Bates, M.I.C.E., Craven Street, Birkenhead, on payment of a deposit of £2 2s. for each specification. Fair wages clause. Tenders, which must be on the printed form supplied, sealed and endorsed, "Tender for —," must be sent in so as to reach Alfred Gill, town clerk, Town Hall, Birkenhead, not later than 9 a.m. on May 29.

May 29. Tyldesley-with-Shakerley.—Alterations to hydraulic drains including new gas-tar and liquor take-off pipes and erection of two tar towers, for the U.D.C. Plan of same may be seen at the Gasworks, Tyldesley, and specification and tender form obtained from the engineer, R. H. Gimman. Sealed endorsed tenders, on official forms only, to be sent to W. J. Matthews, clerk to the Council, Council Offices, Tyldesley, not later than noon on May 29.

May 29. London, S.W.—Hot-water heating apparatus in the lower administration block at the South-western Fever Hospital, Landor Road, Stockwell, S.W., for the Metropolitan Asylums Board, in accordance with drawing and specification prepared by W. T. Hatch, M.I.C.E., M.I.M.E., engineer-in-chief. Drawing, specification, conditions of contract and form of tender may be inspected at the Office of the Board, Embankment, London, E.C., and can be obtained upon payment of a deposit of £1. Tenders, addressed as noted on the form, must be delivered at the Office of the Board not later than 10 a.m. on May 29.

May 30. Mansfield.—Execution of the following works in connection with the Corporation Electricity Supply Undertaking:—Section M.—Battery of Accumulators and reversible booster. Section N.—Switchgear. Tenderers are at liberty to tender for either section, but not for part of a section. The specification, with terms and conditions, forms of tender, and form of contract, may be inspected at the offices of Robert Hammond & Son, consulting engineers to the Corporation, 64, Victoria Street, Westminster, London, S.W., and may be obtained there on making a deposit of £5 5s. Extra copies of the specification may be obtained by bona fide tenderers at a charge of 5s. per copy, which will not be refunded. Tenders, sealed and marked "Tender for Mansfield Electricity Works," must be delivered to J. Harrop White, town clerk, Town Clerk's Offices, Mansfield, before noon on May 30. Each tender must contain the names of two sureties who will be prepared to execute a joint and several bond for the due performance of the contract in the sum of 10 per cent. of the contract amount.

June 1. Torquay.—Electricity supply extensions.—Contract No. 3: Supply, delivery and erection complete of condensing plant, consisting of one surface condenser and steam-driven air and circulating water pumps, together with the necessary pipework connections between the existing pipes and the above plant, and sundry other ironwork. The specification and form of tender can be obtained on application to Town Clerk, Town Hall, Torquay, on payment of a fee of £2 2s. A copy of the specification, general conditions and drawings may be inspected (but not obtained) at the offices of the consulting engineers, Kincaid, Waller, Manville & Dawson, 29, Great George Street, Westminster, S.W. Sealed tenders, endorsed "Electricity Extensions, Tender for Contract No. 3," must be forwarded to Frederick S. Hex, town clerk, Town Hall, Torquay, at or before noon on June 1.

June 2. South Shields.—Installation of electric light in the Senior Department of the Westoe Road Schools. Copies of the drawings, specification and form of tender can be obtained from J. H. Cawthra, M.I.E.E., borough electrical engineer, South Shields. Tenders on the form supplied must be delivered to the Secretary to the Education Committee at his office, Ocean Road, South Shields, on or before noon on June 2, endorsed "Tender for Wiring Westoe Road Schools."

June 8. Devonport.—Completion of the Embankment road and sewers at Camel's Head, Devonport. Drawings and specification may be seen, form of tender, bill of quantities and all further particulars obtained, on application to James Diggle & Son, civil engineers, 14, Victoria Street, Westminster; or at the Clerk of Works' Office, Sewage-disposal Works, Camel's Head, Devonport. Sealed tenders, endorsed "Camel's Head Embankment," to be sent to R. J. Fittall, town clerk, Town Clerk's Office, Devonport, not later than noon on June 8.

June 10. Egypt.—Supply of various pumps, pipes and pump fittings, for the Egyptian State Railways Department. A copy of the list, conditions, plan, &c., may be obtained, price 4s., from Lieut-Colonel Western, Queen Anne's Chambers, Broadway, Westminster, S.W. Tenders to be sent in by June 10.

June 11. Burnham.—Supply, delivery and erection of a suction gas plant, gas-engine and treble-ram pump, in connection with the waterworks, for the U.D.C. Specification and drawings may be obtained from the waterworks engineer, W. H. Chowias, Manor Gardens, Burnham, on payment of £2 2s. Tenders, on the prescribed form only, endorsed "Tender for Machinery," must be delivered to D. S. Watson, clerk, Town Hall, Burnham, Somerset, on or before June 11.

June 18. Bristol.—Construction and maintenance for twelve months after completion of the following works at the Royal Edward Dock, Avonmouth, now in course of construction:—Two upper storied transit sheds, each

500ft. long; one single floor transit shed, 450ft. long; a granary to contain 50,000 quarters of grain. Parties desiring to tender may submit tenders for:—Any one of the four buildings alone; the two upper storied transit sheds together in one tender; the whole of the four buildings together in one tender; any other combination of two or more buildings in one tender. Tenders for the upper storied sheds are invited for one or both of the following alternative methods of construction:—(1) Steel construction; (2) Ferro-concrete construction. Tenders for the granary are invited for any or all of the following methods of construction:—(1) Brick construction; (2) ferro-concrete construction; (3) timber construction. Copies of the specification, form of tender, form of contract and copies of contract drawings, of which there are three sets, namely, one for the two upper storied sheds, one for the single floor shed and one for the granary, can be obtained from W. W. Squire, engineer, Engineer's Office, Cumberland Road, Bristol, on production of a receipt from secretary of the Docks Committee showing that £3 has been paid as deposit on each set of drawings applied for. Tenders must be enclosed in a sealed envelope, endorsed "Tender for Sheds and Granary, Royal Edward Dock," and addressed to the Secretary of the Docks Committee, 19, Queen Square, Bristol, and must be delivered to him accompanied by the prescribed documents before 10 a.m. on June 18.

June 30. Cairo.—*Supplies and works in connection with the water supply of Menouf, including engine-houses, pumping machinery, motors, conduits, and steel water tower and reservoir.* Specifications, plans, &c., may be seen at the Ministry of the Interior, Cairo. Tenders will be received by the European Secretary of the Ministry of the Interior, Cairo, up to June 30.

IRON AND STEEL.

May 28. Ross.—*Iron roofing, &c. of new stabling, and the fire-engine station; also for additional calves' pens at the stock market, according to the plans and specifications which may be seen at the Council Offices.* Separate tenders for each work, endorsed "Stabling," "Fire Engine Station," or "Calves' Pens," to be delivered at the Council Offices, Albion Chambers, Ross, not later than noon, on May 28.

May 30. Salford.—*Cast-iron pipes, &c., for roughing filters at the Salford Sewage Works.* The drawings may be seen and forms of tender, with specification and quantities, obtained at the Borough Engineer's Office, Town Hall, Salford. Tenders, endorsed "Pipes for Roughing Filters," addressed to the Chairman of the River Committee, must be delivered to L. C. Evans, town clerk, Town Hall, Salford, not later than 4 p.m. on May 30.

June 6. Ipswich.—*Supply and fixing of three iron staircases at the Union Workhouse, at Barham, to the outside faces of the wings—two on the men's side and one on the women's side; the work to be completed in accordance with sketches, details and specifications, which, together with the form of contract to be entered into for the execution of the work, may be inspected at the offices of the Guardians, 6, Providence Street, Ipswich.* Orders to view the premises will be forwarded on application to the Clerk. Tenders should reach the offices of the Guardians, 6, Provident Street, Ipswich, by June 6.

June 11. Nottingham.—*Supply of the under-mentioned goods, for the ensuing year, for the Water Department:—Cast-iron double-faced sluice-valves and hydrants; cast-iron main pipes; lead piping, lead ingots; gunmetal taps and ferrule fittings. Specifications and drawings, together with samples, weights, &c., may be seen and other information obtained at the office of the water engineer, F. W. Davies, St. Peter's Churchside, and forms of tender may be obtained at that office on payment of £1 rs. Tenders, endorsed "Tender for Valves," "Tender for Pipes," "Tender for Lead," "Tender for Taps," to be delivered to Samuel G. Johnson, town clerk, Guildhall, Nottingham, on or before June 11.*

PAINTING AND PLUMBING.

May 24. Chesterfield.—*Painting and cleaning the Christ Church National School, Stonegraves.* Specification of the work to be done and form of tender may be had on application to C. J. Kerslake, secy., Education Offices, Chesterfield, by whom tenders will be received up to May 24.

May 24. Chesterfield.—*Painting and cleaning the cookery and laundry departments of the Central School.* Specification of the work to be done and form of tender may be had on application to C. J. Kerslake, secy., Education Offices Chesterfield, to whom tenders should be sent by May 24.

May 25. Carlisle.—*Painting and other works required to be done at four of the elementary schools, such works to be commenced on July 2 and completed not later than July 21 next. Specification and full particulars may be obtained from the surveyor on payment of 10s. 6d. Sealed tenders, endorsed "Tender for Painting, &c.," to be delivered to Henry C. Marks, M.I.C.E., surveyor, 36, Fisher Street, Carlisle, not later than 10 a.m. on May 25.*

May 25. Cardiff.—*Painting, decorating, papering, &c. to the Avondale and Lord Wimborne Hotels, Cardiff, for Crosswell's Brewery Co., Ltd.* Particulars and specification can be obtained at the offices of A. O. Evans, Williams & Evans, architects, Pontypridd, to whom sealed and endorsed tenders must be sent by May 25.

May 26. Lancaster.—*Painting at the Abbey Light houses and other property at Glasson Dock and Lancaster for the Port Commissioners.* Particulars may be had at the Tonnage Office, Lancaster, and tenders should be in by May 26.

May 26. Edinburgh.—*Painting the Reference Library at the Central Library, George IV. Bridge according to specification, which may be seen at the Public Works Office, and schedules of quantities, which may be had on personal application. The estimates must be sealed and marked "Tender for Painter Work, Public Library," and sent to R. Morham, city architect,*

Public Works Office, City Chambers, Edinburgh, by 10 a.m. on May 26.

May 26. West Bromwich.—*Cleaning and painting of the interior of the Town Hall and offices, in accordance with specification and conditions of contract, to be seen on application to the Borough Surveyor. Sealed tenders, properly endorsed "Tender for Painting Town Hall," on the form provided, to be forwarded to Albert D. Greatorex, M.I.C.E., borough engineer and surveyor, Borough Surveyor's Office, Town Hall, West Bromwich, not later than noon on May 26.*

May 28. Dartford.—*Painting and renovating the interior of certain of the workhouse buildings in accordance with a specification which may be seen at the office of the master of the workhouse. Tenders to be delivered at the office of J. C. Hayward, clerk, Sessions House, Dartford, on or before 2 p.m. on May 28, endorsed "Tender for Painting."*

May 28. Govan.—*Painter work required for new laundry block at Merryflatts, Govan. Plans can be seen and copies of schedules had on application to the architects, Thomson & Sandilands, 4, Jane Street, Blythwood Square, on payment of £1 rs. Schedules to be filled up and returned sealed and marked "Offer for Painter Work, New Laundry Block," to John Thomson, governor, Merryflatts, Govan, not later than noon on May 28.*

May 29. Grays.—*Painting and distempering at the Free Library. Specifications may be seen at the office of the Council's Surveyor. Tenders endorsed "Tender for Painting," to be delivered to F. W. Saxton, librarian, Free Library, Grays, by noon on May 29.*

May 30. Ramsbottom.—*Painting and decorating work required at Peel Brow Council School, Ramsbottom. Specification and form of tender may be had at the Education Offices, Market Place, Ramsbottom. Tenders to be sealed, and endorsed "Tender for Painting Peel Brow Council School," and delivered to W. Dilworth, clerk, Education Offices, Market Place, Ramsbottom, on or before May 30.*

May 30. Pontygarth.—*Painting Pontygarth footbridge, which adjoins the Taffs Well Railway Station, for the Llandaff and Dinas Powis R.D.C., in accordance with a specification which may be obtained on application to the surveyor, James Holden, A.M.I.C.E., 20, Park Place, Cardiff. Tenders, sealed and endorsed, to be sent to M. Warren, clerk, Park House, Cardiff, not later than noon on May 30.*

May 30. London, N.—*Internal and external cleaning and painting works, at the Northern Convalescent Fever Hospital, Winchmore Hill, London, N., for the Metropolitan Asylums Board, in accordance with specification prepared by W. T. Hatch, M.I.C.E., M.I.M.E., engineer-in-chief. Specification, conditions of contract, bill of quantities, and form of tender may be inspected at the office of the board, Embankment, London, E.C., and bill of quantities and form of tender can then be obtained upon payment of a deposit of £1. Tenders addressed as noted on the form, must be delivered at the office of the board not later than 10 a.m. on May 30.*

June 5. London, S.E.—*Painting at infirmary, Brook Street, Kennington Road, S.E., for the Guardians of the parish of Lambeth. Tenders, which will be received only on the printed form, sealed and endorsed "Tender for Painting at Infirmary," must be sent by post to the Clerk on or before June 5, and will be opened at the board-room at noon on the following day, when all persons tendering, or their authorised agents, must be in attendance. Forms of tender may be obtained, and draft of contract may be inspected, at the Guardians' Board-room and Offices, Brook Street, Kennington Road, S.E., on any day between 10 and 5. Specification and estimate will be supplied on personal application, and on payment of £2 in respect thereof.*

Bury St. Edmunds.—*Painting the Bell Temperance Hotel, &c., and executing certain other work as set forth in the specification prepared by the Borough Surveyor, and which may be examined at his office. Sealed tenders, endorsed "Tender for Painting Temperance Hotel," to be sent to Walter D. Harding, borough surveyor, Town Hall, Bury St. Edmunds, not later than 9 a.m. on June 13.*

No date. London, E.—*Distempering and painting works at the workhouse, St. Leonard's Street, Bromley-by-Bow, E., for the Guardians of Stepney Union. Printed form of tender and specification can be obtained upon application to T. G. Stacey, clerk, Guardians' Offices, Barnes Street, Stepney, E.*

ROADS AND CARTAGE.

May 24. Torpoint.—*Stone for the U.D.C. in the following quantities:—Notter stones, machine broken 500 tons, gravel 80 tons. For forms of tender and further particulars apply to F. A. Clark, surveyor to the Council, 83, Old Town Street, Plymouth, to whom tenders should be sent by noon on May 24.*

May 24. Isle of Wight.—*Supply of materials for the repair of roads and highways in districts numbered 13 and 14, known as Totland and Freshwater district respectively, for three years, for the R.D.C., in accordance with conditions and specifications which have been revised and approved by the Council. Copies of such conditions and specifications and forms and conditions for tender and approximate estimates of the quantities required may be obtained on application at the offices. Each tender must be on one of the forms supplied, and must be enclosed separately in a sealed envelope marked on the outside "Tender for No. (—) District," and must be delivered at the R.D.C. Offices, Pyle Street, Newport, I.W., before 5 p.m. on May 24.*

May 24. Friern Barnet.—*Supply of about 500 tons hardcore, 500 tons hoggins, 1,500 tons of gravel, and 1,000 tons of broken Leicester granite at New Southgate (Great Northern) Railway Station, and such further quantities as may be required until March, 1907. Also for cartage of material and general horse hire for a period of twelve months. Further information and forms of tender may be obtained from E. J. Reynolds, A.M.I.C.E., the Council's surveyor. Sealed tenders, endorsed "Tenders for —," or, as the case may be, addressed to Edwin Goodship,*

clerk of the Council, Council Chambers, Beaconsfield Road, Friern Barnet, together with samples, must be delivered at the Council Chambers before noon on May 24.

May 26. Audenshaw.—*Sewering, paving, kerbing, flagging, &c., of Canning Street and Chatham Street, for the U.D.C. Plans and specifications may be seen and form of tender obtained at the office of William Clough, engineer and surveyor to the Council, upon payment of £1. Tenders must be endorsed "Chatham Street," and reach F. Hamer, clerk, Council Offices, 2, Guide Lane, Audenshaw, not later than May 26.*

May 28. Surbiton.—*Private street works at Ravenscar Road and Cranes Drive, in the urban district of Surbiton. Plans and specifications can be inspected at the offices of the Council during office hours, and a copy of the estimated quantities will be supplied at the request of those who have examined the plans. Sealed tenders, made out on the forms and enclosed in the envelope supplied, must be delivered at the District Council Offices, Surbiton, before 10 a.m. on May 28.*

May 28. Portsmouth.—*Laying and maintaining compressed asphalt pavement in certain streets. A lithographed copy of the specification, form of tender and schedule of prices may be obtained on application at the Town Hall, Portsmouth, on payment of £2 2s. The form of tender, with schedule of prices attached to the specification, must be filled in, and the whole sent, under cover, to Alexander Hellard, town clerk, Town Hall, Portsmouth, not later than 10 a.m. on May 28. Fair wages clause.*

May 28. Urmston.—*Flagging and kerbing of the footways of Station Bridge, Urmston, and its approaches, for the U.D.C. Plans, specifications and forms of tender may be obtained from James Heath, surveyor to the Council. Sealed tenders must be delivered to T. J. Rowland, clerk to the Council, Council Offices, Urmston, not later than 4 p.m. on May 28.*

May 28. Wallsend.—*Cementing of footpaths or parts of footpaths in certain of the streets in the borough as may from time to time be ordered to be done up to the end of September, 1906. Specification for the work may be seen, and particulars and forms of tender may be obtained on application to George Hollings, borough surveyor, Corporation Offices, Wallsend. Tenders, sealed and endorsed "Tenders for Cementing," to be sent to W. V. Mulcaster, town clerk of Wallsend, 28, Sandhill, Newcastle-on-Tyne, on or before noon on May 28.*

May 29. Huddersfield.—*Carting away of ashes and for the general carting in connection with the Electricity Department. Particulars and forms of tender may be obtained upon application to the Borough Electrical Engineer, St. Andrew's Road, Huddersfield. Sealed tenders, endorsed "Tender for Carting Work," signed in the handwriting of the tenderer or his agent, and addressed to Town Clerk, Town Hall, Huddersfield," must reach him not later than May 29.*

May 29. Stratford-on-Avon.—*Supply of broken and unbroken road metal required for the maintenance of the borough roads during the ensuing year, according to specification to be obtained, together with form of tender, on application to Roden Dixon, A.M.I.C.E., borough surveyor, Municipal Offices, Stratford-upon-Avon, with whom tenders endorsed "Tender for Stone" are to be delivered not later than May 29.*

May 29. St. Neots.—*Road material for the U.D.C. Supply of and delivery to St. Neots Station, G.N.R., of about 1,000 tons broken granite and 50 tons ironstone slag. Particulars and forms of tender can be obtained on application to John Edey, surveyor, South Street, St. Neots, Hunts, to whom sealed and endorsed tenders and samples are to be delivered by 4 p.m. on May 29.*

May 29. West Hartlepool.—*Construction of Tankerville Street Footpath (Grange Road to Milton Road), and Back Grange Road and Hutton Avenue, in two portions. Plans, sections and specifications can be seen and forms of tender with approximate quantities obtained upon application at the Borough Surveyor's Office. Tenders, endorsed "Construction of Streets," and addressed to the Chairman of the Works Committee, are to be delivered at the office of the Town Clerk, 78, Church Street, not later than 4 p.m. on May 29.*

May 30. Kingston-upon-Thames.—*Supply of 1,500 tons of gneiss, Guernsey, or other granite, suitable for road-making, 1,000 tons to be broken so as to pass through a ring having a 2in. internal diameter, and the remainder through a 1½in. ring. The above sizes will be strictly enforced. Tenders to be on forms to be obtained of the Borough Surveyor, at the Municipal Offices, where samples must be left. Sealed tenders, endorsed, to be delivered at the Municipal Offices, Kingston-upon-Thames, on or before May 30.*

May 30. Worksop.—*Supply of 120 tons of granite, broken to 2½in. gauge, and 80 tons of granite, broken to 1½in. gauge, delivered at Worksop Station. Tenders must be sent in to George H. Featherston, clerk, Town Hall, Worksop, by May 30.*

May 31. Stocksbridge.—*Road material:—Granite or whinstone about 300 tons; dress (or cinder) about 600 tons; screenings about 200 tons. Particulars, with forms of tender, to be had from J. Marsden, clerk to the Council, Council Offices, Stocksbridge, to whom sealed tenders, endorsed "Material," must be sent before May 31.*

May 31. Habrough.—*Repair of the playgrounds of the council school either (1) with tar macadam, (2) asphalt or (3) with gravel. Tenders to be sent to the Rev. C. C. Marriss, Habrough Vicarage, Lincs., not later than May 31.*

June 2. Chingford.—*Making-up and paving certain portion of the Station Road, for the U.D.C., and for certain other works in connection therewith, in accordance with plans and specifications prepared by the Council's Surveyor, copies of which may be obtained on application and upon payment of a deposit of £2 2s. Tenders, which are to be sealed and endorsed "Tender for Street Improvements," to be delivered to Leonard C. Bowen, clerk to the Council 34, Station Road, Chingford, on or before noon on June 2.*

(Continued on p. xxvi.)

Notes and News.

A Subway to the Albert Hall is proposed to be constructed by the Metropolitan District Railway.

The Proceedings of the Devon and Exeter Architectural Society for 1905-6 have just been issued.

The Ruskin Museum at Sheffield was visited by more than 40,000 people during the past year.

Messrs. Sheen & Wells, heating engineers, of Sheffield, have received instructions to fix their improved small-pipe hot-water heating apparatus in St. Saviour's Church, Retford.

Mr. R. McG. Dawkins is the successor of Mr. Bosanquet in the directorship of the British school at Athens. Mr. Bosanquet having been appointed recently to the Chair of Archæology at Liverpool University.

Mr. T. E. Colcutt, F.R.I.B.A., is nominated as the new president of the Institute, in succession to Mr. Belcher. For the eighteen members of council there are thirty-eight nominations. The results will be made known on June 11th.

Society of Architects' Scholarship.—Thirteen candidates presented themselves for the competitive examination in architectural history and freehand drawing held on May 10th, in London, and the scholarship (value £10 per annum, tenable for three years) has been awarded by the council to Mr. Harold Fletcher Trew, of the Gables, Tuffley, Glos.

Sheffield Society of Architects and Surveyors.—At the annual meeting of this Society held last Thursday Mr. E. Holmes was re-elected president; Mr. W. C. Fenton vice-president; Council (Fellows): Messrs. H. Coverdale, C. B. Flockton, W. J. Hale, H. L. Paterson, A. E. Turnell and J. B. Mitchell-Withers; (Associates): Messrs. W. G. Buck, C. F. Innocent and H. I. Potter.

Surveyors' Institution: Junior Dinner.—The annual dinner held in connection with the junior meetings of the Surveyors' Institution took place at the Trocadero Restaurant on Wednesday last, the chair being occupied by Mr. G. P. Knowles. During the evening a presentation was made by the members of the committee to Mr. Sydney A. Smith, the hon. secretary, to commemorate his term of office.

A new Central Fire-station for Croydon is being erected on a site 62ft. by 168ft. at the corner of Park Lane and Park Street. The building contract has been let to Messrs. Hudson & Co., of Westminster, for £8,575. The total cost of the station will be £10,500. The heating installation will be carried out by Messrs. Wenham & Waters, of Croydon. The plans of the building have been prepared in the borough engineer's office, with the architectural assistance of Mr. Holder.

The Central Arcade at Newcastle was opened on Saturday. Thus the triangular block of buildings bounded by Grey Street, Grainger Street and Market Street will at last fulfil its legitimate function—that of purely business purposes. The elevations towards the arcade are designed in a phase of Renaissance and have been executed in Burmantofts faience, the various tints of which give a refined and restful appearance to what it is hoped will become a favourite shopping resort. The arcade shops have lofty basements lined with white-glazed bricks, and approached by a separate subway from Market Street. The upper floors are partly devoted to offices. The greater portion, however, is occupied by the Central Exchange Hotel. The architects of the new arcade were Messrs. J. Oswald & Son, of Newcastle, and the contractors Messrs. R. Veitch & Sons.

A new Chapel at Taunton School is being erected at an estimated cost of £10,000. Mr. Frank Wills, F.R.I.B.A., of Bristol, is the architect, and Messrs W. Cowlin & Sons are the contractors.

A new Spooling Mill, 243ft. by 120ft. and three storeys high, with basement, is to be erected at Paisley by Messrs. Coats.

A new Mechanics' Institute has been erected at Pontardulais at a cost of £2,000 from designs by Mr. W. Beddoe Rees, architect, of Cardiff.

New Sewage-disposal Works on the bacteriological system have been constructed by the Corporation at Newcastle-under-Lyme at a cost of £25,000.

The Restoration of St. William's College, York—the ancient buildings in the shadow of the Minster—is now nearing completion. Mr. Temple Moore is the architect in charge.

A new Roman Catholic Church at Eastbourne is to be built on a vacant piece of ground adjoining St. Joseph's Roman Catholic Schools in Whitley Road. Mr. P. D. Stonham is the architect for the building, which is to seat about 350 worshippers.

The Public and Architecture: R.I.B.A. Pronouncement.—The Royal Institute of British Architects hope shortly to issue definite information which will assist in the education of the public in regard to architecture, "and to adopt other means to increase the knowledge of those qualities which should be looked for in good architecture."

OUR PLATES.

THE Mount, Sunningdale, is built on a good site with fine views to the south and west. The walls are covered externally with rough plaster, and the roof is of "Eureka" green slates. The windows on the south and west sides have external louver shutters. Messrs. J. Oldrid Scott & Son, of 2, Dean's Yard, Westminster, were the architects, and Messrs. Morris & Son, of Sunningdale, the contractors.

The Frimley Urban District Council Offices have just been erected at Camberley, Surrey, from designs (selected in competition) by Messrs. H. R. and B. A. Poulter, architects, of Camberley. The site is a very restricted corner one, with no possibility of lighting from the west side. The accommodation consists of a basement containing heating chamber, coal store and a large storage room for cycles, approached by a sloping way from the entrance lobby; ground floor containing entrance hall with corridor on left to surveyor's public and private offices, medical officer's laboratory, sanitary inspector's office, cloakroom and lavatory accommodation; first floor containing council chamber (well lit by four semicircular dormer windows piercing a plaster barrel ceiling, and two side windows), committee room and retiring room. The whole of the building internally is finished in white plaster with the woodwork painted dark brown. The building is carried out in local overburnt bricks relieved with local red facing bricks. The window frames and main cornice are of wood painted white. The central part of the front elevation is executed in Monk's Park stone. The roof is covered with local red tiles. These offices have been most soundly and carefully built for the low price of £2,339 (exclusive of the clock turret, which has been omitted) by Mr. William Watson, builder, of Ascot, under the personal supervision of the architects. The heating was carried out by Messrs. Renton Gibbs, of Liverpool. The iron casements and lead lights were by Mr. J. A. Girdler, of Reading. The drawing illustrated is exhibited at the Royal Academy.

Electrical Notes.

The Electrical Standards Laboratory.

This laboratory, in Whitehall, is one of very great interest, as it comprises so much apparatus of the most marvellous delicacy. There are the standard ampere balance and standard 100-volt voltmeter, the former measuring to 65 parts in a million and the latter to 84 parts in a million. By means of other balances and shunts currents up to 10,000 amperes can be measured, and there are other voltmeters which register up to 12,000 volts. Smaller currents and pressures are measured by potentiometers. In a very small room, which is kept at a constant temperature by an automatic device, the standard ohm and other important resistance coils may be seen and the process shown for the comparisons of ohms to the exactitude of 1 part in a million. The testing of meters is carried out in the verification room, where many different types may be seen undergoing the exhaustive test for official approval of "construction and pattern." Outside in the area is a battery room, a rheostat for controlling 10,000 amperes, and a dynamo and booster room.

Electric Power and Nuisance.

The Commissioners of Works have issued a memorandum in regard to possible injury to trees and flowers in the public parks of London by reason of the products of combustion emitted by electricity generating works; and they are not free from doubt as to whether the great national treasures in museums and picture galleries may not also be affected. They have thought it right, therefore, in view of the introduction of legislative schemes, to draw the attention of Parliament to the point, so that the matter may be fully taken into account in any enquiry regarding those projects. The case is not entirely one of the emission or con-

sumption of black smoke or sooty or tarry matters. The other products of combustion, such as sulphurous and sulphuric acid, with solid particles of mineral matter or ash, are very deleterious to vegetation, to buildings, and to pictures, marbles, &c. The Commissioners consider that the cluster of stations arising in the near neighbourhood of Regent's Park and other works growing up elsewhere may cause them peculiar uneasiness on account of their situation. Many furnaces and chimneys are, it is admitted, abolished by the institution of great electrical works; but the enormous amount of coal used by such works is equal to the consumption of tens of thousands of houses or small factories. This is a very serious matter when many of these works chance to be gathered within a limited area. The general condition of the atmosphere of London cannot be ignored. There is, too, the question of vibration.

How Small a Plant can be Made Profitable.

In how small a town is it possible to successfully operate an electric-lighting plant? That question formed the subject of a paper delivered recently before the Dublin Local section of the Institution of Electrical Engineers by Mr. R. B. Forster, A.M.I.E.E. Mr. Forster did not bring forward a series of arguments for and against, but gave details of a small plant which actually had been, and is still, successful in a town of 800 inhabitants, in competition with a gas company. The example cited was, as one might expect, in America—the village of Western Springs, Illinois, to wit, about seventeen miles west of Chicago. The conditions under which it is worked are by no means ideal, coal having to be hauled some distance. There are three horizontal tubular boilers and the engine is 100 h.p. belt-coupled to a 1,000 volt 60 k.w., two-phase S.K.C. dynamo; the field current being supplied by a

1½ k.w. exciter driven by a belt off the dynamo shaft. The outside work is carried out on the usual American plan, i.e., overhead bare conductors strung on wooden poles. There are two pairs of mains, one pair connected to each phase of the dynamo. One pair is used for private lighting and other for street lighting, the line and voltage in each case being transformed from 1,000 to 110 volts by means of transformers fixed on the poles. On the street-lighting mains there are 100 32 c.p. and 6 Jandus arc lamps, the lights in nearly all cases being suspended over the middle of the street. On the private lighting mains there are eighty consumers. This plant made a profit on the annual turnover, the price for current to the consumer being 10 cents (5d.) per kilowatt-hour. One of the chief drawbacks to the use of electric lighting in private houses, said Mr. Forster, was the cost of installation; and if we had cheaper wiring we should find electricity more generally used. In this connection he referred to

Cleat Wiring

or concealed wiring by means of porcelain tubes. Cleat wiring, he said, although not used much in this country made a very good job if properly installed. The chief objection to it was its unsightly appearance. This, however, was reduced to a minimum if the first and last pairs of cleats were put in at the start, then the wires pulled tight, and the intermediate cleats put in last. By this means all the cleats were brought into line. When the installation was to be carried out in a building during construction the joists were bored with a brace, porcelain tubes were slipped in, and the wires strung through these, tassings being taken off for the lights and switches. In this system the wires could be kept a good distance apart throughout their entire length, only coming in contact with the porcelain tubes, so that the insulation resistance was as perfect as possible.

(Continued on p. 283.)

June 2. London, W.—*Providing and laying complete upon the main roads about 3,200 lineal yds. of 12in. by 6in. Norwegian granite kerbing and 12in. by 6in. Norwegian granite channelling, and about 3,200 sq. yds. of Victoria stone paving, and all other incidental works, for the Heston and Isleworth U.D.C. Plans and specifications can be seen and forms of tender, together with bills of quantities and any other particulars, obtained from P. G. Parkman, A.M.I.C.E., engineer and surveyor, Council House, Hounslow, W., upon payment of a deposit of £2 2s. Sealed tenders, endorsed "Main Road Paving," must be sent to H. J. Baker, clerk to the Council, Council House, Hounslow, W., not later than June 2.*

June 2. Cramlington.—*Materials, for the U.D.C. Contract No. 1: The supply of about 1,500 tons of machine broken whinstone, to be delivered at Cramlington Station and Dam Dykes Siding. Contract No. 2: The cartage of and haul stone on to the highways, and the provision of a horse and man for watercart. Contract No. 3: The hire of a steam roller, and watercart or carts. Full particulars, specifications, conditions, and form of tender relating to the above contracts can be had on application to W. J. Coulson, surveyor, Council Office, Cramlington. Sealed tenders, endorsed "Tender," must reach the office of Robert Nicholson, solicitor and notary public clerk to the Council, 51, Bridge Street, Morpeth, not later than June 2.*

June 5. Bishop's Stortford.—*Paving and improving various footpaths in the district, for the U.D.C. Plans and specifications can be seen at the office of the Council's surveyor, R. S. Scott, A.M.I.C.E., 7, North Street, Bishop's Stortford. Tenders, endorsed "Tender for Street Works," to be sent to Thomas Swathbridge, clerk, Council Offices, 7, North Street, Bishop's Stortford, by 4 p.m. on June 5.*

June 6. London, E.C.—*Laying of about 1,070 yds. of tar pavement in the Finsbury Circus Gardens, for the Corporation. Further particulars to be obtained upon application to the City Engineer, Guildhall, E.C. Tenders must be addressed, Town Clerk, Public Health Department, Guildhall, E.C., and delivered at the office of the Hallkeeper, Guildhall, on or before June 6.*

June 6. London, W.—*Making-up of the following roads:—Belsize Avenue; Kingsley Avenue (2nd portion); Leighton Road (2nd portion); Corfton Road (2nd portion). The drawings and specification may be seen and form of tender, together with schedule of quantities and other particulars, obtained from Charles Jones, M.I.C.E., borough engineer, Town Hall, Ealing, W., any day during office hours upon payment of a deposit of 10s. 6d. for each road. Sealed tenders, in the envelopes provided, endorsed "Tender for Making-up," must be delivered at the office of George E. Brydges, town clerk, Town Clerk's Office, Town Hall, Ealing, W., not later than 9.30 a.m. on June 6.*

June 6. London, N.—*Sewering, levelling, paving, channelling, &c., Preston's Court, within the borough of Hornsey. Forms of tender, &c., and all information can be obtained from E. J. Lovegrove, borough engineer and surveyor, Municipal Offices, 99, Southwood Lane, Highgate, on any morning between 10 and 12. Tenders must be on the prescribed form, and be delivered or sent by post (sealed and endorsed), so as to be deposited in the tender-box in the Town Clerk's Office by 4 p.m. on June 6. Quantities, duly completed, must accompany the tenders.*

June 6. Hove.—*Executing paving and other works in Lawrence Road (between Rutland Gardens and Raphael Road) and Tamworth Road (between Portland Road and Montgomery Street). Further particulars may be obtained, and plans and specifications seen at the office of the Borough Surveyor. Tenders, on forms supplied, endorsed "Tender for Lawrence Road" or "Tamworth Road," as the case may be, will be received by H. Endacott, town clerk, Town Hall, Hove, up to 6 p.m. on June 6.*

June 6. Romney Marsh.—*Supply and delivery of 300 yds. of quartzite of zin. gauge to the parishes and roads hereunder stated:—100 yds. Guldeford Road, Brookland; 100 yds. Straight Road, Brookland; 100 yds. Snaive Road, Brenzett. The above material to be delivered before September 15, 1906, and yarded at the expense of the contractor in such a manner and in such quantities as the surveyor may direct and subject to his measurement. Tenders, endorsed "Quartzite," to be delivered to W. B. Smith, district surveyor, New Romney, not later than June 6.*

No date. Ross.—*Making a new road to The Coppice, Bishopswood. Contractors can see the plans and specification upon application to Arthur H. Pearson, architect, Ross.*

No date. Calverley.—*Granite, limestone, dress, &c., for the U.D.C. Particulars and forms of tender can be obtained from W. Walker, surveyor, Council Offices, Calverley.*

SANITARY.

May 24. Brentwood.—*Connecting certain premises on Shenfield Common, Brentwood. To the sewer there, for the Billericay R.D.C., according to plans and specifications to be seen by appointment with S. J. Shelley, Junction Road, Brentwood. Tenders to be securely sealed, and marked "Tender for Connections," and sent to C. Edgar Lewis, clerk, Brentwood, by May 24.*

May 25. Manchester.—*Construction of pipe sewers, manholes, &c., on the new roads, Blackley Estate. Drawings may be seen and specification, bill of quantities, and form of tender obtained on application at City Surveyor's Office, Town Hall, Manchester, on payment to the City Treasurer of £2 2s. All cheques or postal orders are to be made payable to the order of "The Corporation of Manchester." Tenders, enclosed in the official envelope and addressed to the chairman of the Sanitary Committee, to be delivered at the City Surveyor's Office not later than 10 a.m. on May 25.*

May 23. Ross.—*Sewerage along Greytree Road, Merryyn Lodge to Palmerston House (Ashfield), and from Tudorville to Duxmere, according to the plans and specifications, which may be seen at the Council Offices.*

Separate tenders for each work, endorsed "Sewer Market Road," "Sewer Ashfield," or "Sewer Tudorville," to be delivered at the Council Offices, Albion Chambers, Ross, not later than noon on May 28.

May 28. Wells.—*Constructing new surface and storm water drains at the Union Workhouse. The plan and specification may be seen at the office of C. Brown, city surveyor, from whom all information may be obtained. Sealed tenders must be sent to Alfred George Russ, Poor Law Offices, High Street, Wells, on or before May 28.*

May 29. Methley.—*Construction of the work contained in the Methley Junction Extension, for the U.D.C. Plans and specifications may be seen, and quantities with form of tender obtained, from the engineer, John Stocks Richardson, C.E., East Parade Chambers, Leeds, on payment of £1 1s. Tenders endorsed "Tender for Sewerage Works," must be delivered to Robert S. Wigin, clerk, 83, Albion Street, Leeds, not later than noon on May 29.*

May 28. Bootle.—*Construction of public conveniences on the east side of Miranda Road continuation, adjoining the Bootle Cricket Ground. Plans and specification may be seen and bills of quantities obtained at the office of the Borough Engineer. Tenders, sealed and endorsed "Public Conveniences, Miranda Road," to be delivered to J. Henry Farmer, town clerk, Town Hall, Bootle, not later than 10 a.m. on May 28.*

June 2. Guildford.—*Construction of about the following lengths of surface-water drainage in the Charlottetown and Guildford Park Estates, inclusive of all necessary manholes, gulleys and connections, outfall, &c.:—95 yds. run of 45in. by 30in. armoured egg-shaped concrete tubes; 180 yds. run of 30in. armoured concrete tubes; 490 yds. run of 24in. armoured concrete tubes; 830 yds. run of 18in. armoured concrete tubes; 132 yds. run of 15in. armoured concrete tubes; 180 yds. run of 9in. stoneware pipe. Plans and sections may be seen and copies of the specification, bill of quantities and form of tender obtained on application to C. G. Mason, A.M.I.C.E., borough engineer and surveyor, upon payment of £3 3s. Sealed tenders, endorsed "Tender for Charlottetown and Guildford Park Surface-Water Drainage," are to be sent to F. S. Miller, town clerk, Town Clerk's Office, Bridge Street, Guildford, on or before noon on June 2.*

June 6. London, W.—*New relief effluent water sewer from southern works to River Thames, and manholes &c., in connection therewith, as under:—about 3,700 ft. of 24 in. pipe. The drawings and specifications may be seen, and forms of tender, together with schedule of quantities and other particulars, obtained from C. Jones, M.I.C.E., borough engineer, Town Hall, Ealing, W., any day during office hours, upon payment of a deposit of £3 3s. Sealed tenders, in the envelope provided, endorsed "Tender for New Relief Effluent Water Sewer," must be delivered to George E. Brydges, town clerk, Town Clerk's Office, Town Hall, Ealing, W., not later than the first post on June 6.*

June 7. Cheadle.—*Construction of about 400 lineal yds. of 9in. and 37 lineal yds. 12in. earthenware pipe sewers, with manholes, &c., at Grove Lane, Cheadle Hulme, for the R.D.C. Plans and drawings may be seen, and copies of the specifications and bill of quantities obtained on application to E. Sykes, C.E., between 10 and 12 daily until the 31st May (Saturdays excepted), on deposit of £1 1s. Tenders, duly sealed, and endorsed "Tender for Sewers," may be addressed to Arthur Briggs, clerk to Cheadle and Gatley U.D.C., Council Offices, Cheadle, near Manchester, on or before June 7.*

June 9. Glasgow.—*Construction of Sewer No. 1 (Contract No. 1a), extending from Moss Road, North of Cardonald Station, to a point near Paisley Road, South of Ibrox Station, for the Corporation. Plans, specifications, and working drawings may be seen, and specifications and schedules of quantities and forms obtained, on application to the City Engineer at his office, City Chambers, 64, Cochran Street, Glasgow, on payment of a fee of £5 5s. Sealed offers, marked outside "Tender for Sewer No. 1 (Contract No. 1a)," must be lodged with A. W. Myles, town clerk, City Chambers, Glasgow, not later than June 9. The resident engineer will meet intending offerers at Cardonald Station on the arrival of the 10.35 train from St. Enoch Station on May 25.*

June 11. Fenton.—*Sewage-disposal works, for the U.D.C. Outfall sewers comprising about 1,800 yds. of 15in. stoneware pipes and about 2,800 yds. of 15in. cast-iron pipes, including manholes where required, also the construction of liquefying tanks and bacteria beds, pump well, erection of engine-houses and manager's house and other incidental works in connection therewith. Plans and specification of the proposed works may be seen and bills of quantities obtained on application at the office of S. A. Goodall, surveyor to the Council, Town Hall, Fenton, Staffordshire, on payment of a deposit of £5. Plans, specification and a copy of the bill of quantities may also be inspected at the offices of Willcox & Raikes, consulting engineers, 63, Temple Row, Birmingham. Sealed tenders, endorsed "Fenton Sewage-disposal," to be delivered at the office of R. T. Adderley, clerk to the Council, Town Hall, Fenton, Staffs., not later than noon on June 11.*

June 15. Huddersfield.—*Construction of Sewage disposal works at Berry Brow, for the Honley and South Crosland Joint Sewerage Board. The works comprise bacteria continuous filter beds, circular tanks, mud bed, laying out storm water and land filtration areas, with carrier, &c., small pumping station, the construction of new road, &c. The plans may be seen and quantities and form of tender obtained at the office of the "Engineer," W. H. Radford, C.E., Albion Chambers, King Street, Nottingham, on deposit of £3 3s. Sealed and endorsed tenders must be sent in to Alfred I. Slocombe, clerk to the Joint Board, Huddersfield, on or before June 15.*

No date. Frosterley.—*Draining of the bottom level of Harehope Quarry, Frosterley. About 270 yds. of open cutting will be necessary, and about 400 yds. underground. The watercourse will have to be 4ft. 6ins. high and 4ft. wide. Full particulars, forms of tenders, &c., may be obtained on application to the Secretary, Harehope Mining and Quarrying Company, Ltd., Frosterley, R.S.O., Weardale, co. Durham.*

TIMBER.

May 29. London, W.—*Supply of 100 fathoms of best yellow deal ends, to be delivered cartage free at the Workhouse, Isleworth, for the Guardians. Tenders, upon forms which may be obtained at the office of William Stephens, clerk to the Guardians, Union Offices, Isleworth, W., to whom tenders must be sent by 4 p.m. on May 29.*

May 30. Dublin.—*Supply of 30,000 creosoted rectangular sleepers 8ft. 11ins. by 10ins. by 5ins. (17,000 to be delivered in July, 1906, and 13,000 in March, 1907), for the Dublin, Wicklow and Wexford Railway Co. Specifications and forms of tender can be had on application to the Secretary. Tenders, marked "Tenders for Sleepers," and addressed to the Secretary, Dublin, Wicklow and Wexford Railway, Westlandrow Station, Dublin, to be forwarded so as to reach him not later than 10 a.m. on May 30.*

June 1. Southampton.—*Supply of deals and matched boarding, for the Director-General, Ordnance Survey. Applications for forms of tender and specification should be made to the Officer in Charge of Stores, Ordnance Survey Office, Southampton. All tenders must be submitted before noon on June 1.*

June 2. South Hetton.—*Supply of all kinds of colliery timber from July 13, 1906, to the June 30, 1907, for the South Hetton Coal Co., Ltd. Forms of tender, with full conditions, may be obtained on application to J. R. Lambert, South Hetton, near Sunderland. Tenders, addressed to the South Hetton Coal Co., Ltd., South Hetton, near Sunderland, will be received up to June 2.*

June 20. Egypt.—*Supply of 200,000 oak and 100,000 pine sleepers, for the Egyptian State Railways Department. Copies of the specification may be had, price 2s. each, from Lieut.-Col. Western, Queen Anne's Chambers, Broadway, Westminster, S.W. Tenders will be received up to June 20.*

MISCELLANEOUS.

May 30. London, E.C.—*Supply of builders' engineers', smiths', plumbers', gasfitters' and miscellaneous ironmongery and electrical accessories, for the Metropolitan Asylums Board. Form of tender upon which alone tenders will be received, giving all particulars, can be obtained at the Office of the Board, Embankment, London, E.C., where tenders duly filled up must be delivered not later than 10 a.m. on May 30. Those whose tenders are accepted will be informed accordingly in due course.*

June 5. Failsworth.—*Supply of the under-mentioned materials and stores during the period of twelve months ending June 11, 1907: paving setts, curbs, flags, Portland cement, earthenware pipes, bends, junctions, and gulleys, Buxton lime, green crystal coppers, disinfectants, and galvanised sanitary pails. Forms of tender and further particulars may be obtained at the office of G. F. Gray, surveyor, Council Offices, Failsworth. Sealed tenders on forms supplied, and endorsed "Tender for—," must be delivered to H. C. Broome, clerk to the Council, Failsworth, not later than noon on June 5.*

June 7, 9 and 12. Copenhagen.—*Supply of (1) cables, and (2) electric light meters to the Copenhagen Lighting Department; and (3) 4,400 cast iron pipes to the Copenhagen Water Works. The conditions (in Danish) may be inspected at the offices of the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, London, E.C. Copies of Conditions for (1) and (2) may be obtained from the Director of Public Lighting, No. 22, Vestre Boulevard, Copenhagen, at which address tenders must arrive by mid-day on June 7 and 9, respectively. Copies of (3) may be obtained from the office of the Water Works, Copenhagen, where tenders will be received up to mid-day on June 12.*

June 7. Penrikyber.—*Supply of the following stores, for the Penrikyber Navigation Colliery Co., Ltd., Penrikyber R.S.O., Glam.:—Iron and steel; castings; bolts, nuts, rivets, iron washers and nails; miners' lamps and lamp glasses, electric lamps and fittings; steam, water and gas-metal fittings, &c.; ironmongery, files, saws, gouges, colliers' tools, helves, shovels and sundry stores; paints, brushes, brooms, &c.; pitch-pine deals, red pine, best quality, American birch boards and deals, poplar and elm curbs, elm, G. and T. match and flooring boards; wire ropes; lime and cement; oils. Forms of tender can be obtained on application to the Secretary, to whom tenders must be sent not later than June 7.*

June 8. Thornaby-on-Tees.—*For the under-mentioned works, for the Corporation:—Contract No. 1: Laying-out, levelling, roadmaking, turfing, railbase, &c. Contract No. 2: Wrought-iron railings, gates, &c. Plans, specifications, and bills of quantities may be seen, and forms of tender and other particulars obtained, at the Borough Engineer's Office, Town Hall, Thornaby-on-Tees, during the usual office hours, on depositing cheque or postal order value £2. Tenders, on the prescribed form only, must be sent to the Town Clerk in sealed envelopes provided for the purpose, on or before June 8.*

June 13. Cape Town.—*Supply of: 3-ton bronze wire, No. 18; 5 m/fe bronze wire, braided steel No. 18; 2,200 yds. cable V.I.R., 20/10; 2 pairs; 1,100 yds. cable, V.I.R., 20/10; 8 pairs; 440 yds. cable, V.I.R., 12 pairs; 440 yds. cable, V.I.R., 16 pairs; 440 yds. aerial cable, dry core, 52 pairs; 4-ton wire galvanised steel No. 11. For particulars apply to the Controller of Stores, G.P.O., Cape Town. Tenders to be sent in to the Chairman of the Tenders Board, Control and Audit Office, Parliament Street, Cape Town, by June 13.*

June 16. Radcliffe.—*Supply of the following materials, for the U.D.C.: Granite setts; steel girder tramrails, fishplates, tie-bars, bolts, nuts, points and crossings, and other special trackwork. Specifications and forms of tender may be obtained on application to W. L. Rothwell, engineer to the Council, on payment of a fee of £2 2s. Tenders, endorsed "Tramway Materials," to be sent to S. Mills, clerk, Council Offices, Radcliffe, on or before June 16.*

THE BUILDERS' JOURNAL

AND ARCHITECTURAL ENGINEER.

May 23rd, 1906.

CONCRETE AND STEEL SUPPLEMENT (MONTHLY).

FOREWORD.

Changes in Construction.

ALTHOUGH the older generation of architects is reluctant to confess it, it cannot be disputed that with the advent of the twentieth century our whole ideas as to the building of commercial structures have been rapidly changing. All concerned in the erection of business premises, in buildings of the warehouse and factory class, and in structures where economy is a first essential, must realize that the constructional requirements of modern buildings are undergoing very marked changes.

Causes of Changes.

The causes of these changes are twofold, the first being the introduction of the steel-frame building, the second the invention of reinforced concrete.

Engineering & the Architect.

With the advent of these the architect is also gradually finding that a far greater amount of engineering knowledge is required of him than was previously the case. Some architects overcome this by employing engineering assistants or by having consultative advice on the engineering aspect of the problems put before them. But, no matter what assistance be obtained, he would indeed be a poor architect who did not carefully study and thoroughly inform himself of the primary principles of construction and calculation that are involved.

Engineering & the Builder.

Almost—though not entirely—in the same degree the builder is finding that a thorough knowledge of structural engineering problems is a most useful adjunct in the conduct of larger works, and he also is in many instances finding it advisable to engage engineers on his staff and to have regular consultative engineering advice. But here again, no matter what assistance may be obtained, he would indeed be a poor type of contractor who was not desirous of carefully informing himself as to the constructional and economic bearings of the movement towards the increased use of steel and concrete in buildings. Though work of this kind may be carried out by specialists, it is obvious that contractors who wish to keep up with the times may also have to undertake a considerable amount of this work themselves without the aid of sub-contractors.

Our new Supplement.

Having regard to this evolution in the requirements of the architect and of the contractor, and to the fact that many of our readers are specifically engaged in constructional engineering, we have decided to extend our series of supplements by yet another, to be known as the "Concrete and Steel" Supplement. This will deal in general with the multitudinous uses of concrete and steel in modern construction, and with the problems of the steel-frame building and reinforced concrete in particular.

To be issued Monthly.

No excuse is needed for this further development of our sphere of activity, for our regular readers will have noticed from month to month that we have had to devote more and more space to these two subjects to fulfil a growing demand for information. As with fire matters, and questions relating to the business side of contractors' work, we think our readers will find it more practical and convenient that we should collate such information as we have been giving, extend it and systematically present it in the form of a special monthly supplement, so that they may anticipate exactly when the particular information they require will be at hand, and also where data can be easily found when required for reference purposes.

Our Programme.

As to our programme for this supplement, we would rather not enter into details at this stage, having regard to the rapid development of this subject. Suffice it to say that we shall deal with every aspect of the subject as it concerns building construction, that we have secured the services of the best authorities as contributors, and that we shall copiously illustrate work by photographs and drawings, believing this to be an educational feature of the highest value in technical journalism.

Contributions.

We shall be glad to consider articles and illustrations on subjects within the province of this supplement. The articles we particularly desire are those which embody the results of personal experience and original research. Photographs should be sharp in detail and illustrative of the construction employed, while drawings are preferred in black line without wash of any sort. Communications should be marked "Concrete and Steel Supplement," and addressed to the Editor, "Builders' Journal," 6, Great New Street, London, E.C.

THE EARLY USE OF CONCRETE.

By Thomas Potter.

THERE can be no doubt that concrete has been in use for building purposes from time immemorial—not made and applied in the way that is usual now, it is true, but with similar results.

In Mexico and Peru fragments of concrete buildings belonging to prehistoric times have been discovered, in the Italian colonies of Magna Græcia there is much evidence that the ancient Greeks used it extensively, while the Romans employed it on a large scale both in this country and in Rome. Professor Middleton said—many years ago—that its use by the Romans could be traced as far back as 500 B.C., and that their method of using it for building walls was very similar to ours at the present time.

Earliest Use.

Probably the use of concrete is identical with the earliest period of employing quarried stone for building walls, where mortar was employed, which would arise almost as a necessity.

The practice in many stone districts in this country now is, and probably always has been, where the thickness of walls permits, to face the latter with roughly squared stone on both sides, to utilize the smaller stones not large enough for facing for the core by bedding them in mortar—filling the interstices between them with the still smaller chippings and waste, and pouring in liquid grout of lime and sand until every crevice is filled. The whole in this way becomes a solid mass.

This simple process must have inevitably occurred to the earliest stone wall builders, and the result was a concrete core, examples of which are to be found in many parts of the world.

A very old Lancashire proverb, which possibly dates from mediæval times, runs:—

"A castle wall to be stout
Must be full of mortar and grout."

Roman and Norman Remains.

Judging from the remains of Roman and Norman buildings in this country—Corfe, Rochester, Pevensey and Richmond Castles, for instance—the method described must have been usually adopted. If the smaller rough stones to form a core were not available, then chippings or other materials were used instead, but the concrete remains of old castle walls are so homogeneous in character and the aggregate generally so considerable in size that the modern method of mixing the materials together on a platform and depositing them *en masse* between the wall facings could not have been the general practice in those days. When circumstances rendered facing with stone unnecessary, boards were used to form encasing panels, just as we do now.

From wall building to the construction of roofs, floors, stairs, &c., with concrete there is a natural sequence. The concrete stairs at Colchester and Rochester Castles show the marks of the encasing boards, as do the fortification walls at Badajos.

The great dome of the Pantheon is mainly of concrete, and there is much evidence that

floors were also formed of concrete in very early times.

Roman and Norman Mortar.

Both Romans and Normans had a thorough knowledge of mortar, as the walls of many roofless castles and the remains of city walls in many parts of the country prove, although exposed to centuries of rain and frost, and apparently as strong now as when built. This is owing in a great measure to the interstices of the stonework being completely occupied by the grout used with the core filling, and to the custom of mixing pounded tiles or bricks with the lime to form mortar, which causes it to acquire increased hardness with time. Hydraulic—or water-resisting—lime was not always available where many ancient castles were built, and no doubt the builders were well aware that the addition of pounded tiles or bricks with a non-hydraulic or rich lime converted it into hydraulic mortar capable of resisting climatic changes.

Lost Knowledge Recovered.

It is singular that a knowledge of this peculiarity should apparently have been lost. Smeaton, when experimenting with a view to adopting suitable materials for building the Eddystone lighthouse, found that when the pure lime was extracted from certain lias limestones the residue was clay, and from this he actually made a brick which, when pounded and mixed with a non-hydraulic lime, entirely changed its character.

Palladio says:

"In ancient times coffer work was made by taking boards laid edgewise, according to the thickness of the walls, filling the space between them with cement and all sorts of small stones mingled together, and continued after this manner from course to course."

Alberti, another ancient architect, also wrote:—

"I have observed that in other places the ancients, who were wonderfully expert in making great works, followed different methods in filling up their foundations. In the sepulchre of Saint Antonini they filled them up with little pieces of very hard stones, each not bigger than a handful, over which they perfectly drowned the mortar. I have known other instances where the ancients have much the same sort of foundations and structures too—of coarse gravel and common stones that they have picked by chance, and which lasted many ages."

Philibert de L'Orme.

a French architect, writing in 1568, describes the usual custom at that period for making concrete as follows:—

"The excavations being made, whether for houses, harbours, bridges or buildings in a marshy soil, or even on land, and if being deep and wide, stones of a large size cannot be used for the foundations. The best and surest method is to prepare a mortar composed of quicklime recently burnt, mixed with river sand which contains a quantity of pebbles of all sizes, provided the largest be not bigger than the fist or the size of an egg, and that the whole be interspersed with smaller pebbles and gravel, such as are usually found in rivers. This material moistened with mortar and mingled with lime serves both for mortar and stone, and mixed with a sufficient quantity of sand must be thrown at once into the excavation, without any labour from the mason's trowel. It is only necessary to dress it with a spade. Having thrown in a layer about half a foot in thickness, large single stones may also be thrown in and mixed here and there with it as may be convenient, but without touching each other; after this you will again throw upon them the mortar of pebbles and gravel as before done, and this must be repeated till the excavation is full, throwing the whole from above with all sorts of small pebbles. The composition thus excited hardens and solidifies so firmly in the foundations that, being heaped up in a mass and bound together, it becomes a uniform body or rock, such as nature forms, of a single block and so strong and hard that when dry it cannot be broken either by piles or any other instrument, nor can the pebbles be separated from it without breaking them to pieces."

Smeaton's Use of Concrete in 1774.

In this country the use of concrete seems to have been almost forgotten or neglected for centuries, until about 1774, when Smeaton wrote about it and practised with it. Other engineers interested themselves in connection with foundations—Rennie, Smirke and Brunel among others—but in a general way its adoption was very slow.

Semple, an engineer, used it for the foundations of a bridge over the Liffey, however, in 1753, and writing about it at the time said:—

"There are three different ways of making use of lime in such a work as this; one is to mix the lime made liquid with its proportion of sand and small stones in

such a manner as may clothe every stone and particle of sand with it; the second to turn them up altogether like mortar; the third to lay each of the three, as it were, in thin layers, still observing the same proportion. Judiciously mix the lime, sand and stones, for if not equally mixed how can you expect them to petrify and unite into one solid mass?"

General Pasley.

in his treatise on limes and cements published in 1847, says:—

"Concrete is a recent improvement first adopted by Sir Robert Smirke (1) with success in the foundations of the Penitentiary at Millbank, where the soil chiefly of peat moss was soft, to a great extent. The origin of its use arose in this way; in excavating for one of the piers of Waterloo Bridge the workmen had a good deal of difficulty, owing to the very compact state of the gravel forming the bed of the river, which everywhere else had been found perfectly loose. The effect had been produced by the accidental sinking of a bargeload of lime over the spot some time before, which had cemented the gravel into a solid mass, resembling the calcareous conglomerates of nature which are gradually formed by a similar process. Mr. Rennie, the engineer, having mentioned the circumstance to Sir Robert Smirke, the latter with great judgment availed himself of the hint, and subsequently used concrete in all his foundations, none of which have ever been known to fail."

This statement is, however, scarcely correct, as a report by Messrs. Rennie, Lewis, Cockerell and Brown dated January, 1813, recommended concrete foundations for Millbank, while Sir Robert Smirke was not consulted in the matter until 1817. It seems somewhat remarkable that General Pasley was conducting a series of experiments with limes and cements at Chatham, within a mile of one of the finest specimens of a building comprising Roman concrete—Rochester Castle—without realizing what a valuable factor in building construction was practically waiting to be developed, and with a knowledge that the Castle had been given to a builder to clear away, but who, luckily, gave the job up in despair by reason of the strength of the concrete core.

The Paris Strike of 1840.

A strike of the carpenters in Paris in 1840 led to the extensive use there of concrete floors, and the *modus operandi* was identical with previous systems of making concrete, viz., a platform was formed at ceiling level, the aggregate was placed on it and levelled off to where required, and liquid grout was run in to fill the interstices. It was impracticable to mix the two materials—the aggregate and the matrix—on mixing boards, owing to the quick-setting nature of the matrix—plaster of Paris.

A system somewhat similar had been employed in Nottinghamshire and Derbyshire, where gypsum quarries were close at hand, and in Italy, for very many years.

In Paris, however, reinforcement (by means of flat bars on edge, rods with their ends turned down to get a grip of the concrete, and other devices, the iron being embedded in the concrete) was gradually introduced and soon became well-known and in common use. The rods and bars were usually fixed near the ceiling level to resist the tension strain, and vertical members were attached thereto, and to corresponding rods or bars near the floor level to resist the shearing stress, a principle similar to systems in use in this and other countries at the present time, and claimed as modern discoveries.

Modern Systems Antedated.

As a matter of fact all known systems of concrete construction for foundations, walls and floors, and generally, are identical with or grounded on similar methods practised—some—many centuries ago, but which the cycle of invention rejuvenates at intervals. The American form of hollow terra block, or burnt clay slab construction, and the many variations of the same are possibly taken from the ancient method of forming floors in Italy, or of quite a similar character adopted in Paris over sixty years ago. The latter form of floor is illustrated in Fairbairn's "Engineering" published in 1870, and possibly in earlier editions of the same work.

First Floor in Paris.

The first concrete floor in which the common form of rolled iron joist was used

as a support for the concrete was for a house No. 18, Boulevard Fillis du Calvaire, Paris, the span being 18ft. At that time rolled iron joists were scarcely known in this country.

In 1856 M. François Coignet, a French engineer, introduced a system of concrete construction which he called "Béton Aggloméré" and in which lime and suitable aggregates—as hitherto—were the component parts. The materials being mixed together dry and thoroughly amalgamated, a very moderate amount of water, just sufficient for adhesion, was sprinkled over the mass.

For wall building temporary wood encasements were used and small portions of the materials were cast therein at a time, workmen then gently tamping or ramming them until they were thoroughly consolidated. There does not appear to have been much novelty in the process; great care in dealing with the work being the principal factor.

M. Coignet stated at a public meeting in Paris that he had erected many buildings with Béton Aggloméré, one being a house three storeys in height, 60ft. by 40ft. on plan, in which every part, walls, floors, roof, string-courses, mouldings, &c., was composed of the material, and without bond iron or lintels of any kind. The component parts of the concrete were—

Sand, gravel and pebbles	-	8 parts.
Clay, burnt and powdered	-	1 "
Cinders, powdered	-	1 "
Unslaked hydraulic lime	-	1½ "

The cost was stated to be 4s. 6d. per cubic yard in some parts, up to 10s. 8d. for others. The description of the materials and the cost of the work read strangely at the present time. The house was said to be near St. Denis; it would be interesting to know if it is still in existence.

Dr. Fox and Mr. Barrett.

Dr. Fox, a doctor practising in Bristol, obtained a patent in 1844—in conjunction with Mr. Barrett, a builder—for floors formed with cast-iron joists and concrete. The joists were deeper in the middle than at the ends and were fixed about 18ins. apart. On the bottom flanges of the joists wood laths about ½ in. square were laid, and a small distance apart, to give a grip to a rough coat of plastering-mortar which was squeezed through from the top to form a key for the ceiling-plaster under. Upon this rough-plaster coat concrete was laid and the surface plastered over with lime-ash mortar and highly trowelled to form a smooth walking surface, a common method in the West of England at that time. This is probably the first kind of concrete and iron floor publicly used in this country. It was adopted for the Grosvenor Hotel, near Victoria Station, and many other buildings.

Early Reinforced Concrete in England.

Wilkinson, of Newcastle, introduced his concrete floors in 1854, and sometimes used iron ropes embedded in the concrete in place of rods or bars, for reinforcement.

Dennett's floor came into use about 1857, Cheynes' about 1863, Hornblower's in 1873, and Swarbrick's in 1875. The last-named was the prototype of the hollow terra-cotta lintel system of construction. The slabs were rebated at the ends to encase the bottom flanges of the joists, as a protection from fire, and had dovetailed projections on the top to key with the concrete filling over. Since the date of Swarbrick's patent the variety of systems of floor construction introduced in this country, on the Continent and in America are legion.

Monolithic Concrete Walls.

As a monolithic wall building material there is but little evidence of the use of concrete in olden times to any great extent, other than as a core between facings of some other materials. The construction of mud, clay and cob walls between planks or boards is a very ancient process in this country,

similar to the tapia walls of Spain, the pisé walls of France and others, and must have been practised in very early times, perhaps co-eval with wattle and daub. Cob walls were very common in this country where some kind of unctuous clay and chalk were procurable, up to within the last fifty years. They were very susceptible to rain and frost, necessitating stone or brick foundations and overhanging eaves to keep them dry. "Mud walling" and thatching were usually combined as one occupation in rural districts, but both have gone so nearly out of use that skilled workmen of that class are now rarely to be met with. It is not at all unlikely that owing to the objections to mud walls, lime-concrete must on occasions have been substituted for cob or mud to fill in between the boards, and it is quite possible that isolated buildings with walls of this kind exist in out-of-the-way districts where lime, gravel or stone chippings were available. Peter Nicholson's dictionary and Cresy's Cyclopædia of Engineering both contain illustrations of panel boards or encasements which would do equally as well for clay, cob or concrete walls.

It is remarkable how soon, comparatively, processes when they go out of use for a time are forgotten, and after an interval are hailed as new discoveries, and as a matter of course made the subject matter of patent rights. In no instance is this more apparent than in the use of concrete. A London architect, writing to a public journal in 1848, says he has used concrete for foundations of buildings in London, but in the provinces he is unable to, as he can find no one who knows anything concerning it. Sir C. W. Pasley writes in 1847 that a Mr. Thomas Cooper had used lime concrete for the formation of a sea-wall at the East cliff, Brighton, some years previous, and that to the best of his belief it was the first application of concrete other than for foundations.

An 1832 Patent.

Mr. Ranger, a Brighton builder, took out a patent in 1832 for making concrete blocks in moulds and using them as masonry. He slaked, or otherwise reduced to a powder, Dorking or Reigate lime, and mixed it with gravel, stone chippings or similar aggregates. The proportions were 1 part of lime to 10 parts of aggregate, mixed and cast in common wood boxes or frames. Apparently the only claim for a new invention was that hot water was used for mixing, to hasten the setting. The College of Surgeons in Lincoln's Inn Fields was built with Ranger's blocks. Sir C. W. Pasley minutely describes the process, in which there was nothing novel, but which shows how little there was known about concrete at that period.

Patents for Concrete Blocks.

Concrete blocks, since Portland cement was in common use, have been the subject matter of many patents, none of which appear to have been commercially successful until lately, when improved forms of metal moulds have facilitated their manufacture.

In the 'seventies Mr. Spencer Hayward, an architect, invented iron moulds in which to cast concrete bricks; Mr. Sidebotham, another architect, introduced concrete slabs for facing walls and filling between with concrete; Mr. Lish, of Newcastle, made moulds for an ingenious method of making hollow blocks, which he called the Z system; Mr. Cornish, a builder, adopted another way of slab-building; Mr. J. C. Sellars, of Birkenhead, made hollow concrete blocks and used presses, dies and other arrangements for their manufacture. These and numerous others for various reasons were in favour only for a time, and so far as I know have been almost forgotten.

The Invention of Portland Cement

Aspdin in 1824 was the primary cause of bringing concrete into more extended use, but it was a slow affair; Mr. James Wylson,

an architect, in his treatise on limes and cements written twenty years after that date, mentions it as having only just been introduced in London, and gives no particulars concerning it, although the first cement manufactory, Frost's, was erected on the Thames in 1825. It was for some reason, however, a failure until Messrs. White & Sons took it over in 1845 and made Portland cement a success.

Sir C. W. Pasley, who had been making many experiments with limes and cements, in a letter written to Dr. Garthe, of Cologne, in 1852, said that although living within ten miles of Robins and Aspdin's manufactory he had never heard of what they were doing until he accidentally met Mr. Aspdin at the Great Exhibition of 1851.

Portland Cement not trusted.

Mr. E. A. Bernays, M.I.C.E., said in a paper read before the Institute of Civil Engineers in 1880 that for the first contract let by the Admiralty for Chatham Dockyard extension works in 1867 so little reliance was placed on Portland cement, that it was not mentioned in the specifications, but that grey stone lime and lias lime from Warwickshire were to be used for brickwork above ground, and Roman cement and Puzzolana from Italy for all work below high-water mark, and for concrete. The last was specified to be made of 1 part of lime to 6 parts of ballast, but a difficulty arising as to the delivery of the lime it was decided to try cement. To avoid a "bill of extras" in the contract, the concrete was made of 1 part of cement to 12 parts of ballast, which balanced the cost. The result, Mr. Bernays said, showed that the cement-concrete was the superior of the two. One to 12, when cement was probably not more than 50 per cent. of its present strength, certainly did not err on the ground of extravagance.

Hydraulic Lime.

Hydraulic lime finely ground will, however, if properly used make substantial concrete walls. I used it largely when cement was a high price, in 1873-4, and built therewith the walls of buildings 18ft. in height and 2ins. in thickness. Those walls showed none of the cracks on the surface which is unfortunately so often the case with Portland cement-concrete walls. The lime was tipped out of the sacks on to a wood floor in a weather-tight shed, and kept a month before being used. The proportions were 1 part lime to 6 parts crushed bricks, both by measure.

Concrete Cottages.

In 1865 Mr. Tall, a bricklayer by trade, brought the use of monolithic cement-concrete walls into much prominence, by the introduction of wood frames or movable panels, very similar to those described by Peter Nicholson, and in Cresy's Cyclopædia, and to the fact that he received a commission from the Emperor of the French to build several concrete cottages at the Paris Exhibition. This created quite a widespread interest in this form of construction. Unfortunately Mr. Tall published such absurd statements as to the strength, cost and easy application of concrete by means of his frames, which turned out quite fallacious, that it almost entirely stopped its adoption, and even now it has not altogether retrieved the good name it should have as a wall building material. As an instance, the following is a copy of one misstatement he made and published as to the cost of building some cottages near Maidstone:—

	£	s.	d.
7 cub. yds. of gravel at 2s. 6d.	0	17	6
7 cub. yds. of Kentish rag stone for packing at 1s. 6d.	0	10	6
1 cub. yd. of Portland cement 16 bushels at 2s. 2d.	1	14	8
Labour per cub. yd., 15 at 2s.	1	10	0
Superintendence 15 cub. yds. at 6d.	0	7	6
Total cost of 15 cub. yds.	£5	0	2

Nothing is said about the cost of the apparatus, except that it was purchased for £100. The concrete was to be made with the gravel as the aggregate, and the Kentish rag bedded, or packed, into the soft concrete, not always advisable in thin walls, and certainly not to the extent of 50 per cent.

As will be noticed, the cement is supposed to form a portion of the measurement, whereas it is entirely disseminated in the interstices of the aggregate, and instead, the concrete itself, from shrinkage when wet, would measure 5 to 15 per cent. less than the aggregate alone.

It will be noticed that Mr. Tall calls a cubic yard of cement 16 bushels, whereas it is 21 bushels, and, strange to say, the formula as given was copied into Laxton at the time, as the basis on which to estimate the cost of concrete walls.

The strength of concrete Mr. Tall modestly put down at ten times the strength of brick walls of a similar thickness. Persons interested in economical buildings had walls, and floors too, constructed in concrete under the impression that so large a margin of strength would allow much liberty to be taken in the method and materials of construction, and, as a result, numerous accidents and several deaths occurred through walls and floors collapsing.

Other Systems of Walling.

Several other forms of appliances for wall building were brought before the public soon after Tall's, Drake's, Osborne's, Henley's and others, all of which appear to have gone out of use. Some really efficient means for building monolithic walls of any height, width, or thickness, and providing for irregular forms of construction and wall projections is wanted. I found no patented appliances—in my own experience—satisfactory, and at last adopted a plan of my own which answered somewhat better.

In 1865-1871, and again in 1880, Mr. John Grant, M.I.C.E., read papers before the Institution, on Portland cement and concrete. Mr. Grant was engineer to the Metropolitan Board of Works, and in that capacity made an extraordinary number of tests with cement and various kinds of aggregates, and there can be no doubt that these experiments had a great influence in inducing cement manufacturers to grind their cement much finer, to subject it to constant chemical analysis, and generally to produce it of a higher standard than had hitherto been the case.

At that time, 1880, the Germans had already been giving the subject much attention and were producing cement of a greater fineness and superior strength than any made in this country.

Hyatt's Researches.

In 1877 Mr. Thaddeus Hyatt published for private circulation the result of a large number of experiments made by Messrs. Kirkaldy for him in connection with concrete for various objects in 1860-70, the results being identical with similar experiments made within the last few years. He proved that concrete, cement and iron when exposed to great heat underwent a similar degree of expansion. A severe fire and water test showed that concrete stood both, without any serious deflection or loss of strength, and he also proved that concrete beams with iron embedded therein were capable of considerable elasticity without rupture, and that when loaded sufficient to effect considerable deflection they resumed their original shape when the load was removed.

Mr. Hyatt also made many experiments with reinforced beams, similar to some that are being adopted at the present time, using rods and bar iron as tension members and corresponding rods near the floor level, linking the two together by vertical bars; he made trials with reinforced beams up to 40 ft. in length and tabulated the results.

It has been said lately that the result of

trials with rods and bars having no arrangement to prevent sliding proved that the grip of the concrete was alone sufficient. Mr. Hyatt rivetted small plates of iron to the ends of his tension rods and bars, and in the published results a considerable number when loaded are stated to have slipped and broken away from the plates.

Major Seddon's Experiments.

In 1874 Major Seddon, R.E., made numerous experiments with unarmoured concrete at Chatham with the object of testing whether it could with safety be adopted for landings and floors for Government buildings. One was with a slab of concrete 14ft. 6ins. by 13ft. in the clear of supports, the sides not pinned into any walls, the materials being 12 parts of broken brick ballast, 4 of cement, and 3 of sand, and 6ins. thick. Eighty men marched on it at quick and double pace, then jumped simultaneously with no effect, but when weighted with 10½ tons of bricks it collapsed. The slab was only twenty-one days old, when it could not have attained more than 50 per cent. of its ultimate strength.

Since that date the use of concrete is modern history.

STRESSES IN REINFORCED CONCRETE BEAMS.—I.

[In future issues of the "Concrete and Steel" Supplement calculations for beams with double reinforcement, T-beams, shear and other points will be dealt with. This first article goes as far as rectangular beams with single reinforcement, and while introductory to succeeding articles refers particularly to floor slabs or beams supporting floors not monolithic therewith.]

WITH the object of demonstrating to ordinary students of building construction the method of designing reinforced concrete beams we have simplified the following discussion so as to bring it within the comprehension of those who have only a limited acquaintance with applied mechanics and mathematics. An explanation of the general beam theory so far as it relates to the particular subject has therefore been incorporated, as it is felt that the majority of the textbooks on applied mechanics do not readily afford an explanation in a form suitable for reference by those who take up the subject for the first time, or indeed for those who have forgotten certain points they once had learned. Indeed, few of the textbooks treat the beam theory adequately;

they mostly dodge points of difficulty, and merely serve for beams of homogeneous material where the moduluses of elasticity in tension and compression are the same.

In the following discussion simple formulæ have been derived by neglecting certain points that have little importance in practice, for the reason that (1) they will thus be more easily understood, (2) it is believed that with simple formulæ there is less risk of error, and (3) elaborate calculations waste time in practice, because the personal equation in the workmanship and the variability in the concrete render impossible anything like exactitude. We see no reason, however, in this last for increasing the factor of safety, because the increase in strength in concrete between the time of striking the centering and six months after, and the fact that the cement is generally of better quality than allowed for, more than make up for the discrepancies between calculation and practice. Therefore, we do not advocate any increase in the usual factor of safety of 4 on the assumed breaking strength of either material.

Steel.

The ordinary breaking strength of mild steel varies between 55,000 lbs. and 65,000 lbs. per sq. in.; the average may be taken as 60,000 lbs. per sq. in. Hard steel has an ultimate strength of about 100,000 lbs. per sq. in. The modulus of elasticity of both steels is about the same, namely, 30,000,000 lbs. per sq. in.

Concrete.

There is a much greater difference between the maximum and minimum values for the strength of concrete than in steel, and it seems unwise to adopt any settled value. It is preferable to determine the strength of any particular concrete by testing blocks prepared from the aggregate and cement to be used on any particular job, at about one month.

For the purpose of this article we shall take the strength of good 1 : 2 : 4 gravel or broken stone concrete as 2,600 lbs. per sq. in. at one month, 3,000 lbs. at three months and 4,000 lbs. at six months. We therefore see that if we adopted a factor of safety of 4 at one month we should have a factor of safety of 6 at six months. The modulus of elasticity of concrete has not yet been determined satisfactorily; it appears to bear a definite relation to the ultimate strength and to vary with the load applied. For 1 : 2 : 4 gravel or stone concrete, different experiments vary between about 2,000,000 and 5,000,000 lbs. per sq. in. Here, for the sake of simplicity, it will be taken as uniformly 3,000,000 lbs. per sq. in.

Symbols.

In the following discussion we shall use the following symbols:—

- b = breadth of beam.
- d = depth of tensile reinforcement from top of beam.
- y = distance from top of beam to neutral axis = zd .
- $d-y$ = distance from tensile reinforcement to neutral axis.
- a = area of steel in tension = wbd .
- E_s = modulus of elasticity of steel = 30,000,000.
- E_c = modulus of elasticity of concrete = 3,000,000.
- s_c = greatest stress in concrete.
- s_s = greatest stress in steel.

Rectangular Beams.

Stress is a force per unit of area, or so many lbs. per sq. in. When a body is stressed it is always accompanied by a change of form or dimensions, which is called the strain. By our definition of strain, when we apply a stress we shall find a strain; and, *vice versa*, when we find a strain, we know it is the result of stress. The modulus of elasticity is the measure of stress divided by strain, or

$$E = \frac{\text{stress}}{\text{strain}}, \text{ and stress} = E \cdot \text{strain}.$$

Fig. 1 shows the condition of a beam when loaded. The fibres at the top are compressed, and those below stretched. AB is the neutral surface where fibres are neither stretched nor compressed.

Fig. 2 shows an enlarged view of the cross-sections CD and EF in Fig. 1. These sections were originally parallel before being strained, but when the beam is loaded, assuming that they remain plane surfaces, they become inclined to one another. JK is the part of the neutral surface between these two cross-sections, which being unstrained remains its original length L . Now draw GH through K (the point where the neutral surface cuts EF) parallel to CD . Then considering any layer MN away from the neutral surface, we see this layer will have altered in length from $JK = MP = L$ to MN . We will call this alteration in length, *i.e.* NP , by the letter l .

FIG. 1

FIG. 2

FIG. 3

FIG. 5

FIG. 6

FIG. 4

The strain consequently will be $\frac{l}{L}$. If we make the assumption that plane sections remain plane after bending, the strain will be proportional to the distance from the neutral surface, because $EH:NP::EK:NK$. The stress, however, may not thus vary regularly according to the distance from the neutral surface, for stress = E · strain, and there is a possibility of the modulus of elasticity changing also. We shall, however, as above stated, for the sake of simplicity, assume the E to be constant, so that the stress will therefore vary only as the distance from the neutral axis and the sum of all the compressive stresses will be equal to the area of a wedge, as shown in perspective in Fig. 4 and in elevation in Fig. 3.

Let us consider the detail view of the section EF in Fig. 3, where EH is the deformation in the concrete on the top of the beam under any load and GF is the deformation at the bottom of the beam, gf being the deformation in the steel and $g'f'$ the deformation in the only portion of the concrete below the neutral axis which remains uncracked by reason of the tensile stress at this point not having exceeded the tensile resistance of concrete. Under the load in question the deformation is greatest in the concrete at EH and in the steel at gf . As stated above, the stress being assumed to be proportional to the strain, the greatest stresses on the two materials will be at these respective points. The greatest stress in the concrete we will call s_c and the greatest stress in the steel s_s . The stress on the outer fibres of the concrete, $s_c = E_c$ · strain, and the strain as explained before is proportional to the distance from the neutral surface. The same applies to the steel. Consequently, $s_c : s_s :: E_c \text{ strain} : E_s \text{ strain} :: E_c y : E_s (d-y)$

$$s_c = \frac{E_c \cdot y'}{E_c (d-y)} \text{ and } s_s = \frac{E_s \cdot d-y'}{E_s y} \dots (I)$$

Parallel Forces.

With beams we are dealing with a set of parallel forces. Thus in Fig. 1 we have a beam supporting four loads w_1, w_2, w_3 and w_4 . Elementary mechanics teach us that forces may be replaced by a resultant which will have the same effect as the various forces; also that when a system of parallel forces is in equilibrium their algebraic sum must be zero, in order that there may be no motion in a straight line (*i.e.*, translation), and further that the algebraic sum of their moments about any axis must also be zero, so that there may be no motion of rotation. These two facts are stated as $\Sigma W = 0$ and $\Sigma wl = 0$, where ΣW means $w_1 + w_2 + w_3$, &c., and Σwl means $w_1 l_1 + w_2 l_2 + w_3 l_3$, &c., where l_1, l_2, l_3 , &c., are the lever arms of the forces from the axis in question.

Now as the resultant of several forces is the algebraic sum of the forces and the moment of the resultant is the algebraic sum of the moments of the forces we derive the formulas $R = \Sigma W$ and $Rl_r = \Sigma wl$,

where l_r = the lever arm of the resultant.

Couples.

A couple is a system of equal and opposite parallel forces not acting in the same straight line. A couple has no resultant, for it will be seen that $R = W - W = 0$.

In a beam there is one couple formed by the resultants of the horizontal forces and another couple formed by the resultants of the vertical forces. Calling the former R_h and the latter R_v , we see that the algebraic sum of the horizontal forces is

$$R_h - R_h = 0 \dots (2)$$

and of the vertical forces

$$R_v - R_v = 0 \dots (3)$$

Hence two couples acting on a body have no resultant, and therefore there is no motion of translation. They may, however, have a tendency to rotation unless the algebraic

sum of the moments of the couples is zero $\dots (4)$

Fig. 5 shows two couples acting on a body. The algebraic sum of the moments about any axis is $R_h d_h - R_v h_v$. If these are in equilibrium—

$$R_h d_h - R_v h_v = 0. \therefore R_h d_h = R_v h_v.$$

These are the forces we obtain in a girder, $R_h d_h$ being called the moment of resistance, and $R_v h_v$ the bending moment.

Conditions of Equilibrium.

As stated above there are three conditions to be satisfied to secure equilibrium: firstly, as stated at (2), the sum of the horizontal forces must equal zero; secondly, as stated at (3), the sum of the vertical forces must equal zero; and thirdly, as stated at (4), the sum of the moments of all the forces, horizontal and vertical, must equal zero.

These three conditions may be used to determine whether a given system of forces is in equilibrium or not, or if the system is known to be in equilibrium (as it is in the case of a beam) these conditions may be used to find unknown forces, directions or lever arms provided the number of such unknown quantities does not exceed three.

We have in Fig. 6 the portion of the beam to the right of EF in Fig. 1. As the forces are known to be in equilibrium, we see that

(1) the resultant R_v of the forces w_3 and w_4 must equal the resultant R_v' of the forces R_z and R_v . $\therefore R_v = R_v'$, and we may call both R_v and signify their direction by + or -.

(2) the resultant R_c of the compressive forces above the neutral axis must equal the resultant R_s of the tensile forces below the neutral axis. Therefore we may call both R_h , using opposite signs for each.

(3) the sum of the moments of the forces + R_v , - R_v , + R_h , and - R_h , taken for convenience about the neutral axis, must equal zero. The moment of a couple equals one of the forces multiplied by the distance between the forces; referring to Fig. 5 we see that the distances are respectively d_h and d_v ;

$$\therefore R_h d_h - R_v d_v = 0 \text{ and } R_h d_h = R_v d_v.$$

i.e. the moment of resistance = the bending moment.

Stress on the Concrete.

As the compressive stresses on the concrete vary from zero at the neutral axis to the highest existing stress at the top of the beam in proportion to the distance from the neutral axis, the total stress on the concrete will be represented by the contents of the shaded portion of Fig. 4 multiplied by the highest stress, or $s_c \cdot \frac{by}{2}$.

The resultant R_c will pass through the centre of gravity of the triangle; this is situated $\frac{2}{3}y$ distant from the neutral axis.

As we neglect the tensile stress of the concrete, and as the diameter of the reinforcing rods is small compared with their distance from the neutral axis, it follows that the tensile stress will be $s_s a$, and that the distance of the resultant R_s from the neutral axis will be $d-y$.

Now we have just shown that by the second condition of equilibrium R_c must = R_s , or by substituting

$$s_c \cdot \frac{by}{2} = s_s \cdot a \dots (5)$$

The moment of resistance

$$M_r = R_c \cdot \frac{2}{3}y + R_s (d-y),$$

which, as $R_c = R_s$, becomes

$$M_r = R_s [\frac{2}{3}y + (d-y)] \dots (6)$$

$$\text{or } M_r = R_s [\frac{2}{3}y + (d-y)] \dots (7)$$

The moment of resistance as shown above by the third condition of equilibrium is

equal to the external bending moment, which is dependent upon the manner of loading.

Substituting equation (1) in equation (5) we have—

$$s_c \cdot \frac{by}{2} = s_s \cdot \frac{E_s}{E_c} \cdot \frac{d-y}{y} \cdot a;$$

$$\therefore \frac{b y^2}{2} = a \cdot \frac{E_s}{E_c} \cdot (d-y);$$

$$\therefore y^2 b = 2ad \cdot \frac{E_s}{E_c} - 2ay \cdot \frac{E_s}{E_c};$$

$$\therefore y^2 = \frac{2ad}{b} \cdot \frac{E_s}{E_c} - \frac{2ay}{b} \cdot \frac{E_s}{E_c};$$

$$\therefore y^2 + \frac{2ay}{b} \cdot \frac{E_s}{E_c} = \frac{2ad}{b} \cdot \frac{E_s}{E_c}.$$

This is a simple quadratic equation, and the solution for y is—

$$\begin{aligned} y^2 + \frac{2ay}{b} \cdot \frac{E_s}{E_c} + \left(\frac{a}{b} \cdot \frac{E_s}{E_c}\right)^2 \\ = \frac{2ad}{b} \cdot \frac{E_s}{E_c} + \left(\frac{a}{b} \cdot \frac{E_s}{E_c}\right)^2 \\ = \frac{2ad}{b} \cdot \frac{E_s}{E_c} + \frac{a^2 E_s^2}{b^2 E_c^2} \\ = \frac{a^2 E_s^2}{b^2 E_c^2} \left(\frac{2bd \cdot E_c}{a \cdot E_s} + 1 \right); \end{aligned}$$

$$\therefore y + \frac{a}{b} \cdot \frac{E_s}{E_c} = \frac{a}{b} \cdot \frac{E_s}{E_c} \sqrt{\frac{2bd \cdot E_c}{a \cdot E_s} + 1};$$

$$\therefore y = \frac{a}{b} \cdot \frac{E_s}{E_c} \left(\sqrt{\frac{2bd \cdot E_c}{a \cdot E_s} + 1} - 1 \right) \dots (8)$$

Position of Neutral Axis.

This equation gives the position of the neutral axis, and in specific examples it should be calculated from the ultimate strength of the two materials and not from the ultimate values divided by the factors of safety, because if the factors adopted are different for the two materials the position of the neutral axis then found is not in the same position as it would be at the ultimate strength, for which the beam is really being designed.

For economy we desire to give both steel and concrete the highest stresses they will bear, say, 3,000 lbs. per sq. in. on the concrete and 60,000 lbs. per sq. in. on the

steel. Taking $\frac{E_s}{E_c} = 10$, and putting $y = zd$

and $a = wbd$, we get from equation (1) by substituting values for concrete and steel

$$60,000 = 3,000 \cdot 10 \cdot \frac{d-zd}{zd};$$

$$\therefore \frac{60,000}{30,000} z = 1 - z; \therefore 2z + z = 1;$$

$$\therefore 3z = 1 \text{ and } z = \frac{1}{3} \dots (9)$$

We therefore see that with the assumed values

$$y = \frac{1}{3}d.$$

From equation (5) we get by the same method

$$\frac{3,000bd}{2} = 60,000wb.$$

$$\therefore w = \frac{3,000}{120,000} z = \frac{1}{40} z \dots (10)$$

Substituting equation (9) in equation (10) we get

$$w = \frac{1}{40} \cdot \frac{1}{3} = \frac{1}{120} \text{ or } .008\bar{3}.$$

That is to say, $a = .008\bar{3}bd$, or .83 per cent. of the sectional area of the beam, which is the most economical reinforcement with the above values.

(To be continued.)

SHEAR STRESSES

In Beams of Steel and of Reinforced Concrete.

By Prof. Robert H. Smith,
A.M.I.C.E., M.I.M.E., M.I.E.E., &c.

IT is no part of the object of this article to describe what reinforced concrete is or what it ought to be. It takes a hundred various forms. These, it is safe to say, differ very materially in the degree of efficiency with which they fulfil their main purpose. This purpose is to utilize fully, and in combination, the high tensile strength of steel in ratio to its cost and the high compressive strength of cement-concrete in ratio to its cost. An incidental very important object is to cover the steel so as to prevent its rusting, but with this object the present paper has no direct concern. It may be noted, however, that these two purposes are affected diversely by the amount of water used in mixing the concrete. There appears to be little doubt that wet mixing yields the more efficient protection of the metal from rusting. Close lime-washing, or cement-washing, of iron or steel is probably the most effective of all coatings in preservation from atmospheric corrosion, and if the concrete be dry-mixed there is little or no chance of the metal being well and closely washed with cement on every particle of its surface, unless it be specially brushed over with a thin cement grouting immediately before the filling in of the dry-mixed concrete. On the other hand, although there is some controversy as to the relative test strengths resulting from wet and dry mixtures, there seems no reasonable doubt as to the wet mixture yielding a very materially lower modulus of elasticity. As to the strengths it may be that the wet process yields less tensile strength, but does not affect adversely to any important extent the compressive strength; and, if this be true, it is an important conclusion because in reinforced concrete structures little use of the tensile strength of the concrete is made.

As to the Modulus of Elasticity,

this is a question bearing directly upon the special subject of this article, namely, the shear stresses, because the magnitude of these stresses at critical places in the beam structure depends largely upon the ratio of the two elasticities of concrete and of steel. If these two elastic moduli were equal, there would be zero difficulty in getting the two materials to work together harmoniously in combination. The greater the difference between the moduli, the greater the risk of intense local shear near the surfaces of contact between the two materials. The ratio of the modulus for steel to that for concrete varies, according to recorded tests, from about 20 to 10. The wet mixing reduces that of concrete and so makes this ratio greater than with dry mixing. This by no means proves the all round advantage of dry mixing, but it demonstrates its advantage in respect of the shear strength, considered separately, of beams of reinforced concrete.

In the safe estimation of the stresses, the main thing to remember is that the material is heterogeneous. The mortar itself is a heterogeneous mixture of sand and cement. In the concrete the mixture of the mortar or matrix, with the aggregate of stone, or slag, or cinder, we have heterogeneity in duplicate ratio and on a large granular scale. And when steel is embedded in the concrete we find the heterogeneity increased in a third-power geometrical ratio and the separation between the discordant elements mapped out on a still larger geometrical scale.

As most of the elementary propositions from which are derived all the stress-strain formulæ ordinarily used in text-books for the calculation of strength and stiffness in ties, struts, beams, columns, shafts, &c., &c., are based upon the assumption of homogeneous

material, it is absolutely necessary to examine in what respects these basic principles stand true for non-homogeneous material, and in what degree they require modification for application to such structures as those built in reinforced concrete.

Stresses on Various Sections.

There are certain relations, irrespective of strain, existing between the stresses on sections cutting in different directions through any one point. As these are independent of strain relations, they are unaffected by the elastic moduli, and are equally true for homogeneous and for heterogeneous substances. Calling the direction of trans-

Fig. 1.

verse beam-loading vertical, we find vertical beam sections subjected to normal, either tensile or compressive, stress, and horizontal sections subjected to a normal compressive which may be zero, and is always small. Both vertical and horizontal sections transmit shear stress, and it is one of the above elementary laws independent of strain that the shear stresses on sections at right angles are of equal intensity. In Fig. 1, let τ and κ represent the tensile and compressive normal stresses, and s the shear stresses on the vertical and horizontal sections at any part of a beam, and let θ be the right-handed deviation from the horizontal of any section. Then if t , s , and r be the tensile, shear and resultant total stress per sq. in. on this section at the θ inclination, it is shown by direct resolution and addition of the component forces, when there is no mass acceleration involved, that

$$t = \tau \sin^2 \theta - \kappa \cos^2 \theta + s \sin 2\theta.$$

$$s = \frac{\tau + \kappa}{2} \sin 2\theta + s \cos 2\theta.$$

$$r^2 = t^2 + s^2 = \tau^2 \sin^2 \theta + \kappa^2 \cos^2 \theta + (\tau - \kappa)s \sin 2\theta + s^2.$$

The total stress r is simply the square root of the sum of the squares of the normal and shear stresses. Of course, these expressions appear considerably simpler if the compression κ on the horizontal section be so small that it may be, without material error, written in as 0.

The total stress comes to its maximum and minimum amounts on the same sections as do the normal stresses, and on these same sections the shear stress is found to be zero. The inclinations of these sections is given by—

$$\tan 2\theta = -\frac{2s}{\tau + \kappa}.$$

This corresponds to two values of 2θ diametrically opposite each other, and therefore to two values of θ at right angles. If τ be greater than κ , as is always the case in beams, the maximum stress on one of these sections is of the same sign as τ , and the minimum stress on the section at 90 degs. to this is of the opposite sign to τ . Their values are—

$$t_m = \frac{1}{2} \{ \tau - \kappa \pm \sqrt{(\tau + \kappa)^2 + 4s^2} \},$$

the + giving the maximum and the - the minimum. If κ be nearly 0, then these values are approximately—

$$t_m = \frac{1}{2} \{ \tau \pm \sqrt{\tau^2 + 4s^2} \},$$

Similar calculation shows that the shear stresses come to their maximum and minimum amounts on sections at 45 degs. or midway in angular position, to those of maximum and minimum normal stress.

This mid-position is defined by—

$$\tan 2\theta = \frac{\tau + \kappa}{2s}.$$

The maximum and minimum shears are of equal numerical magnitude and opposite in sign, the shear passing from + to - at the sections of principal normal stress on which the shear is zero. These maximum and minimum shears are—

$$s_m = \pm \frac{1}{2} \sqrt{(\tau + \kappa)^2 + 4s^2}.$$

These are the same as the square root parts of the main normal stresses, and these latter range from maximum to minimum through the same range as do the shear stresses. That is—

$$t_m = \frac{\tau - \kappa}{2} \pm s_m.$$

If κ be nearly zero, the principal shears are approximately

$$s_m = \pm \frac{1}{2} \sqrt{\tau^2 + 4s^2}.$$

All these results are everywhere true independently of strains and of elastic moduli, and therefore equally true of homogeneous and heterogeneous material. They are true of any section in any direction even at the points where it cuts out of the steel and into the concrete of a reinforced concrete beam.

Now in all beams of whatever character the shear stress on horizontal, and therefore also on vertical, sections becomes zero at top and bottom surfaces of the beam, where the normal stress on these sections becomes greatest; and at the neutral axis, where the normal stress is zero on the vertical section, the shear on this section is at its maximum. If t_m indicate the "extreme fibre-stress" at either surface, since $s = 0$ here, the equations give for these surfaces,

$$t_m = \frac{1}{2} \{ \tau_m - \kappa \pm \sqrt{(\tau_m + \kappa)^2} \} \\ = \tau_m \text{ as maximum,} \\ \text{and } -\kappa \text{ as minimum,}$$

the angle θ for these being 90 degs. and 0 degrees, or vertical and horizontal sections. Also on the surface sections at 45 degs. to horizontal the shears are—

$$s_m = \pm \frac{1}{2} (\tau_m + \kappa). \\ = \text{approximately } \pm \frac{1}{2} \tau_m, \text{ if } \kappa \text{ be nearly 0.}$$

It is too commonly imagined by "pocket-book" engineers that there is no shear stress near the upper and lower surfaces of beams, the idea being due to the fact that at these surfaces the shear on vertical and horizontal sections is zero. But we see that the shear on other sections is actually half the "extreme-fibre" tensile or compressive stress. A very serious difference!

At the neutral axis $\tau = 0$, and the formulæ give the stresses

$$t_m = \frac{1}{2} \{ -\kappa \pm \sqrt{\kappa^2 + 4s^2} \} \\ = s \left\{ -\frac{\kappa}{2s} \pm \sqrt{1 + \frac{\kappa^2}{4s^2}} \right\} \\ = \text{approximately } \pm s, \text{ if } \kappa \text{ be nearly 0;}$$

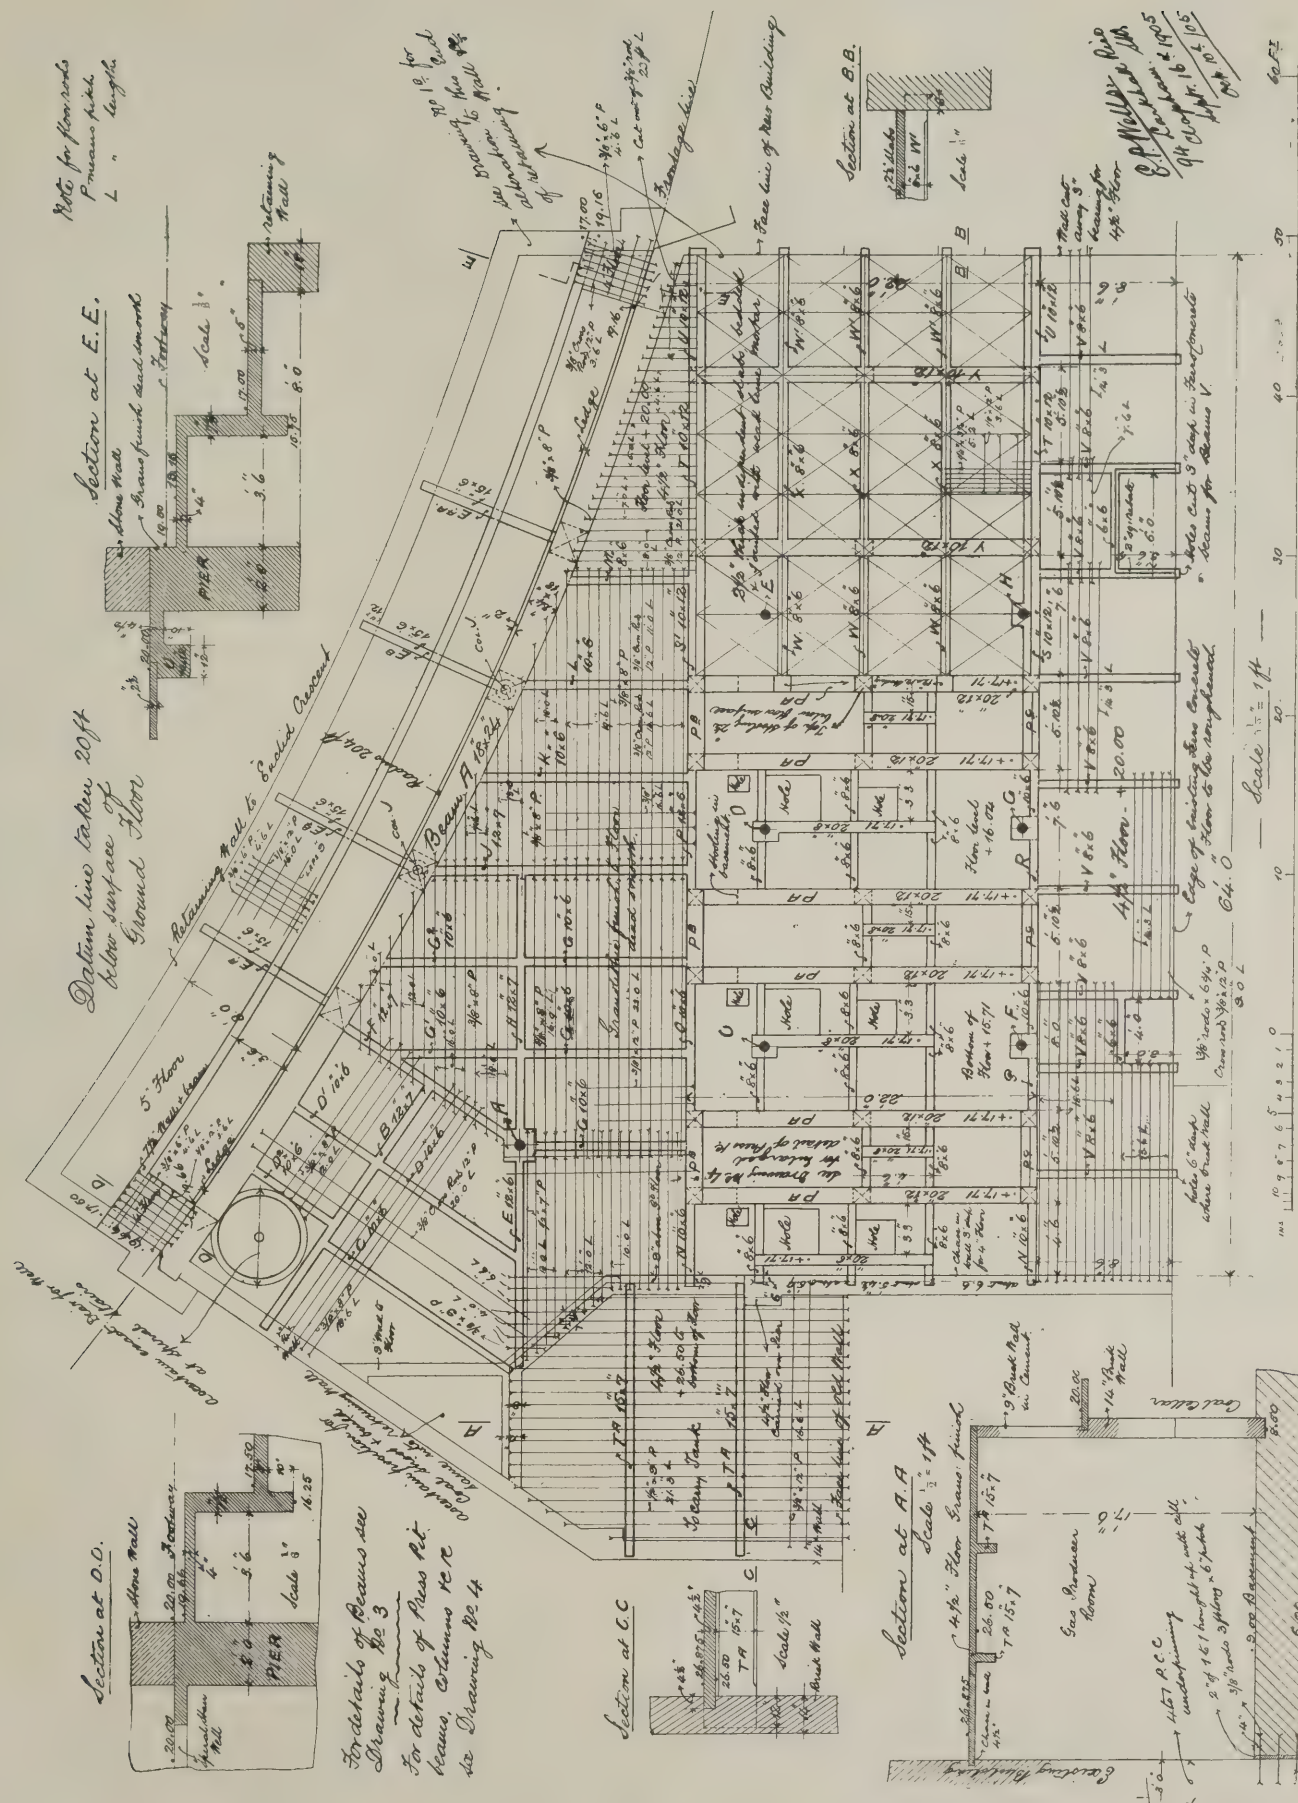

and

$$s_m = \pm \frac{1}{2} \sqrt{\kappa^2 + 4s^2} \\ = \text{approximately } \pm s, \text{ if } \kappa \text{ be nearly 0.}$$

Here again it is a mistaken idea that, because τ is zero on the vertical section, therefore there is no tension in the material. The principal tension equals half the shear stress on the vertical section and is found on a section at the angle θ given by $\tan 2\theta =$

$-\frac{2s}{\kappa}$. If κ be very small, 2θ is just over 90 degs. or just over 270 degs. and therefore θ degs. about 45 degs. or 125 degs. there being tension on one of these sections and compression on the other.

A REINFORCED CONCRETE
NEWSPAPER OFFICE.

Annexe to the "Dundee Courier"
Building.

WE are arranging to publish working drawings for reinforced concrete construction under different systems so as to show the methods by which such work is carried out. In this issue we give the first instalment of working drawings for the reinforced concrete construction of the "Dundee Courier" building now being erected in Dundee. We shall publish further drawings in future issues. These drawings will also serve to compare with the working drawings, which we have also arranged to publish, of the steelwork of the new "Morning Post" building, a steel-frame building being erected in London.

The "Dundee Courier" annexe is being constructed in reinforced concrete by Messrs. Stuart's Granolithic Stone Co., one of the earliest firms in this country to undertake reinforced concrete construction. Their system includes the use of Mr. E. P. Wells's patent system, which is to use twin rods consisting of two round rods united together by a diaphragm, split in order to allow the top rod to be cranked up at the ends at the points of contraflexure, and also punched with holes in the centre to allow indented hoop-iron hangers and borders to be inserted. This is clearly shown in the drawings published in this number. Mr. Wells is the engineer who has designed this work.

The building consists of basement, ground and first floors. The position of this annexe is shown on the ground plan of the whole block, published together with a perspective in our issue for May 24th, 1905.

The architects are Messrs. Niven & Wigglesworth, of 104, High Holborn, W.C. The general contractor is Mr. Stocks, of Dundee. The foundations consist of a raft covering the whole site 3ft. thick. The supporting power of the ground, which is clay, is taken at 1 ton per sq. ft. The whole of the raft is reinforced top and bottom, and carries the various loads placed upon it. The maximum load coming from any column is 57 tons.

In the basement there are three gas engines, two of 112 h.p. and one of 80 h.p., driving dynamos and three Goss printing presses. The retaining walls are also of concrete, sufficiently strong within themselves to resist earth pressure without reinforcement, but are reinforced to prevent any possible chance of cracking. The whole of the basement area is finished off with Stuart's granolithic paving. On the ground floor all the beams and floor are calculated for an inclusive load of $2\frac{1}{2}$ cwt. per sq. ft., the factor of safety being 4 to 1, excluding the concrete. The floors of the press pits and beams are of reinforced concrete and have to carry all the bearing blocks, pulleys, &c., for driving the printing presses which are here situated.

The first floor is also designed for an inclusive load of $2\frac{1}{2}$ cwt. per sq. ft. The whole of the roof, consisting of columns, beams, &c., is of reinforced concrete throughout, and calculated on the same basis as the rest of the work.

Reinforced Concrete and Earthquake Shock.—The "Engineering Record" of New York says, in reference to the earthquake and fire at San Francisco:—"A word about reinforced concrete construction. There was but one example in San Francisco at this time, this construction having been kept out by the existing laws. This building was in course of construction and its concrete portion is intact, while the brick walls are entirely ruined by cracks and will have to be replaced. This was built by the Kahn system. Another small example in Alameda escaped intact, while a brick building 50ft. away has crumbled down."

REINFORCED CONCRETE
CHIMNEYS.

By J. M. KENNEDY, A.M.I.C.E.

THE use of reinforced concrete in connection with constructional works of a most varied nature has deservedly come into general favour during the last few years. From the point of view of fire-resisting qualities, works constructed in this fashion have proved themselves to be superior to anything hitherto known, both on account of the protection afforded to surrounding objects by the non-conducting nature of the material and the absence of sensible damage to the structure itself when suitably designed. Portland cement mixed as described later appears not only capable of withstanding high temperatures, but of doing so as well as ordinary firebricks. It appears therefore that as far as fire-resisting qualities are concerned there is much to be said in favour of reinforced concrete for chimney construction. Several such chimneys have already been erected in America, and one, which will rank among the largest stacks in the United Kingdom, is now in course of erection in the vicinity of London. In America chimneys of this description have been in successful use for several years. Some of these dealing with gases at high temperatures and having an inner protective lining of reinforced concrete only, with air space between the lining and shell, show that so far the heat has had no deleterious effects on the material. In general, however, it would seem that for temperatures constantly above 800 to 1,000 degs. Fahr. a firebrick lining is advisable. This should be built, of course, as with an ordinary brick chimney, quite independently of the main shell and with a 2in. to 4in. air-space between.

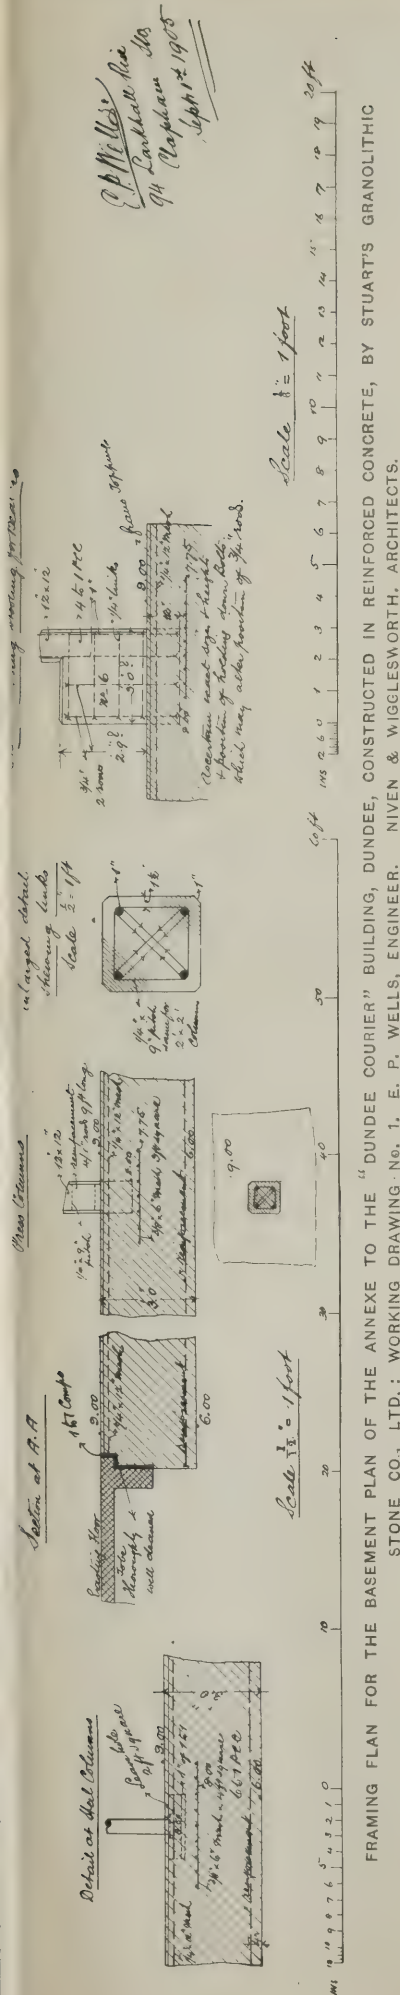

The material itself is heavier than brickwork and mortar bulk for bulk, the latter weighing 112 lbs. per cub. ft. to 150 lbs. scaled by reinforced concrete; but owing to the tensile strength given by the reinforcing steel the walls of the chimney can be made considerably thinner and the total weight greatly reduced. This is, of course, a specially important point where the foundations are of an unstable character and not suitable for carrying heavy weights.

By carrying down the reinforcements of the shaft into the foundation block, and bonding them with all layers of reinforcements therein, the chimney and its foundation become practically one homogeneous mass, and, as will be shown, the stability of the chimney is thereby greatly increased.

General Design.

In order to avoid the expense of special moulds, concrete chimneys must naturally be built with parallel sides and of uniform thickness. By the use of some special flexible form of mould and centering it should be possible to build these chimneys with taper sides without undue extra cost; but so far this has not been accomplished. There is, however, no difficulty in designing a perfectly stable chimney with parallel sides, and in the case of concrete no saving in material would be effected by making it taper.

The calculations of stability will show what is the minimum thickness required for any given height in order that the compressive stress may not under any conditions exceed a safe limit; and this thickness, except in the case of very tall chimneys, or where the thickness of the base for any other reason is necessarily great, should be maintained all through, as it will not generally exceed the minimum thickness which would be considered necessary from purely practical considerations. In the case of a tall chimney where the wind combined with the weight produce an intensity of compressive stress on the lower sections greater than safe limit, increased thickness or diameter of shell must be resorted to in order to obtain a greater area

FRAMING PLAN FOR THE BASEMENT PLAN OF THE ANNEXE TO THE "DUNDEE COURIER" BUILDING, DUNDEE, CONSTRUCTED IN REINFORCED CONCRETE, BY STUART'S GRANOLITHIC STONE CO., LTD.: WORKING DRAWING. No. 1. E. P. WELLS, ENGINEER. NIVEN & WIGGLESWORTH, ARCHITECTS.

over which the load can be distributed. Where a lining or inner shaft is only to be built up to a height of about 50 ft. it may be expedient to keep the inner effective diameter of the shaft constant, and increase the diameter of the outer shell for this bottom section, bevelling it off to the required extent above the top of the inner shell. This lining need not be more than $4\frac{1}{2}$ ins. thick, and a 3 in. to 4 in. air-space should be left between it and the outer shell, the two being entirely independent and suitable ventilation holes being provided. The top of the lining should be corbelled over outwards to butt against the outer shell, and so prevent soot from lodging in the cavity between them; but it must not be prevented from expanding and contracting independently of the shell. If the lining is carried up to any considerable height, space must be left round the top to allow the outer shell to oscillate freely.

A renewable reinforced concrete lining of the above description should be built inside every stack to a height of about 50 ft., even if the gases dealt with are only at a low temperature. For high temperatures a fire-brick lining is recommended.

A light cast-iron cap built up in sections and securely fixed to the top of the chimney will afford considerable protection. It should be put in good electrical connection with the lightning conductor and all reinforcements. If of hollow section it should be filled with coke-breeze concrete.

Experiments with steel rods show that the adhesion in concrete is approximately 500 lbs. per sq. in. of surface exposed. With steel having a tensile strength of 60,000 lbs. per sq. in. the adhesive strength is $\frac{1}{120}$ of the tensile strength, and the necessary superficial area of a rod in concrete to resist drawing out will be 120 times the sectional area of the rod. Consequently it is not necessary to join the longitudinal rods together in any way, but each rod should overlap the rod immediately beneath it by a length sufficient to give a superficial area in the concrete of 120 to 150 times the sectional area of the rod. This will ensure the adhesive strength being as great as the tensile strength, and the rods will break in tension rather than be drawn out of the concrete.

The number of rods to be used depends of course on the total area of reinforcement found necessary from consideration of stability and the size of the section of rod decided upon.

Calculations should be made for sections every 20 ft. or 25 ft. to find the necessary area of reinforcement, so that the number of rods may be reduced accordingly.

Every 18 ins. or 2 ft. horizontal rings must be built into the concrete, binding all the reinforcing rods together and so strengthening the structure against transverse shear.

At the base of the chimney about 2 ft. or at the most 3 ft. in height may be cast every day, though when nearing the top work may progress considerably faster, but should not exceed 5 ft. per day. The centering and moulds should not be struck for about six days, depending on the nature of the cement used.

As regards cost, concrete should hold an advantage over bricks at any rate as far as the cost of materials is concerned, and where men are employed who are used to this class of work a certain saving should be effected in the cost of labour, but this may not be great, because the daily progress is limited, as in the case of a brick stack, to 2 ft. or 3 ft. in height per day. In England so far estimates have shown the cost to be in excess of brick chimneys, but the Weber Steel Concrete Chimney Company claim that they can compete favourably with all other classes of chimney construction in America, and hope to do so in this country also.

Where the flue enters the shaft great care must be taken to avoid weakening the structure. All reinforcements should be diverted

and the concrete thickened up round the opening. The top of the opening should of course be arched and specially reinforced.

Should cracks develop in the chimney they can be grouted up with neat cement. If however a chimney gets out of plumb for any reason, the method of wedges applied to brick chimneys is not applicable and the whole shaft with its foundation will have to be dealt with. Owing to the comparatively light weight this is not such a difficult matter as it might seem.

As regards protection from lightning, a separate conductor appears superfluous owing to the comparatively large sectional area of steelwork available, but in the case of a tall stack an auxiliary copper conductor of not less than 0.7 sq. in. area is advisable. At the top of the chimney all the steel reinforcements should be suitably connected to a coronal ring fixed securely to the concrete and fitted with suitable air terminals. If an auxiliary conductor is employed it must also be efficiently connected to this ring. At the base of the chimney a connection should be made to one of the horizontal reinforcing rings, which should be in good metallic contact with all the vertical rods. This connection should be earthed in a suitable fashion, and the auxiliary conductor also connected to it by means of a removable testing link.

Materials.

Only the very best materials should be employed. The concrete should consist of a mixture of Portland cement and sand in the proportions of 1 of cement to 3 of sand. The use of any aggregate is not recommended except for the foundations.

The cement used should be the finest quality Portland cement and composed of well-burnt clinker finely ground. It should not leave residue of more than 3 per cent. when passed through a sieve with 5,776 meshes per sq. in. The tensile strength should not be less than 450 lbs. per sq. in. after seven days and 580 lbs. after twenty-eight days. The sand should be clean, sharp river sand, free from loam clay, salt or other impurities.

The steel reinforcements should consist of round rods, tee-bars, or any convenient section. They should be of the best quality steel, and should show an ultimate tensile strength of not less than 60,000 to 70,000 lbs. per sq. in., with an elongation of 20 per cent. on 8 ins.

The rods should be embedded in the concrete without any previous preparation or painting, as it has been found that the concrete entirely prevents any corrosion taking place if the materials used are perfectly free from salt or other impurities. The rods should never be less than 2 ins. from the surface of the concrete.

Stability.

The only forces which act on a chimney are those due to its own weight and to the pressure of the wind. As already stated, concrete shafts have for economic reasons been built up till now with parallel sides. The pressure at any section due to the weight alone is therefore directly proportional to the height of the shaft above that section. Allowing 150 lbs. per cub. ft. of reinforced concrete, this works out to approximately 1 lb. per sq. in. per foot of height, and if the maximum safe limit is 500 lbs. per sq. in. the theoretical maximum height with parallel sides will be 500 ft.

When the chimney is subjected to the force of the wind, however, the intensity of the pressure at the leeward side is increased and at the windward side diminished, but before any tensile stress is produced on this side the compressive stress at the other side will have reached twice its normal value.

Thus for a chimney h feet in height above the section under consideration the normal stress will be $1 \times h = h$ lbs. per sq. in. If

s = the effective area in square feet exposed to the wind, which in a round chimney is about 0.6 to 0.7 times the area of the diametrical section, and p = the intensity of the wind pressure in lbs. per square foot, then the total pressure = ps lbs. This pressure will cause a bending moment at the section of $ps \times \frac{h}{2}$ ft.-lbs., which will produce a

maximum stress at the furthest edges of the section from the neutral axis of $\frac{\frac{12ps h}{2} \times \frac{D}{2}}{I}$

lbs. per sq. in., where D is the outside diameter in inches and I the moment of inertia of the section. The wind, therefore, causes a maximum stress of compression at the leeward side and in tension at the windward side of $\frac{3ps h D}{I}$ lbs. per sq. in.,

and the nett stresses are therefore

$$\left(h + \frac{3ps h D}{I}\right) \text{ and } \left(h - \frac{3ps h D}{I}\right)$$

respectively, the latter being in tension only if the difference of the two quantities is negative.

In calculating the stresses to be resisted it is advisable to neglect any tensile strength in the concrete and to rely entirely upon the reinforcements for the tensile resistance. Similarly, in compression it is assumed that the concrete takes all the stress. This latter assumption is not correct, but errs on the safe side. The steel reinforcements, acting as struts and supported throughout their whole length, are capable of bearing a very considerable proportion of the total compressive stress. It is, however, beyond the scope of this article to deal with the somewhat intricate problem which this analysis of stresses involves, and it will be assumed that the concrete has to bear the whole of the stress.

The expression $h + \frac{9ps h D^2}{12I}$ gives the maximum stress to be borne by the concrete in compression. To obtain a value for I in this expression a definite thickness of concrete must be assumed. Taking this by way of trial as 6 ins., allowing for a wind-pressure of 56 lbs. per sq. ft. under normal conditions, and substituting $(0.6 \times \frac{D}{12})$ for s , the expression becomes

$$h + \frac{3 \times 56 \times 0.66 h^2 D^2}{12 I} = h + \frac{9.3 h^2 D^2}{I}$$

If this works out to more than 500 lbs. per sq. in.—the safe limit for concrete—the thickness, and consequently the value, of I must be increased. If less than the limit, the thickness can be diminished, but from practical considerations it should not be reduced to less than approximately 5 ins.

To calculate the necessary area of reinforcement which will resist the maximum nett tensile stress of $h - \frac{9.3 h^2 D^2}{I}$ the rein-

forcement must in the first case be considered to consist of a thin cylinder of steel embedded centrally in the concrete. It is again necessary to assume an area for the section, which may be from 2 per cent. to 3 per cent of the area of the concrete. The maximum stress can then be calculated, and should not exceed from 14,000 lbs. to 16,000 lbs. per sq. in., according to the quality of steel used. When the approximate total area has been calculated the number and size of the reinforcing rods can be determined. These should be spaced about 12 ins. apart at the base of the chimney.

Near the top of the chimney it will probably be found that no reinforcement is necessary. It is advisable, however, to carry a certain proportion of the rods right up to the top. In some cases, especially where any coping or ornamentation is desired,

expanded metal may also be used with advantage.

The above short statement shows roughly how the necessary areas of concrete and steel may be calculated. The stability of the structure as a whole is greatly increased by efficiently bonding the reinforcements in the shaft with those in the foundations. The resistance to rocking is thus increased, as not only would the chimney have to tilt on the furthest edge of its foundation but would also have to lift the mass of earth, &c., upon one side of the foundation block.

The Test of Time.

It remains to be seen of course whether concrete chimneys will stand the test of time, but there is every reason for supposing that they will outlast brick chimneys, as from our knowledge of cement, when properly used, it appears that the whole structure will become practically monolithic. The wonderful strength exhibited by reinforced concrete structures also leads to the supposition that if the chimney is properly designed and the known stresses are kept within safe limits, it should prove amply strong enough to stand any internal or external stresses which it may be called upon to bear.

NOTES AND NEWS.

Reinforced Concrete in Mines.—A curious position of affairs has to be faced by property owners at Bo'ness. Owing to subsidences in the centre of the town through old coal workings sinking in, the town authorities are to erect reinforced concrete piers in the disused mines to prevent danger to North Street. Owners of property on both sides of the street are left to do as they choose—either to put similar piers under their premises or take the risk of subsidence.

An Interesting Catalogue, well illustrated and thoroughly explanatory of the Coignet system of reinforced concrete construction, has just been published from the London offices of M. Edmond Coignet, 4, Chancery Lane, London, W.C., which deserves to be studied by all interested in the subject. M. Coignet was one of the very first to scientifically study reinforced concrete construction, and has done much work.

Hennebique Ferro-Concrete.—The following are some of the contracts which have been settled during the month ending April 15th last, in accordance with the well-known Hennebique system, for which Mr. L. G.

Mouchel, M.Soc.C.E. (France), is the agent-general in the United Kingdom:—*Bridges.*—Firgrove Bridge, Rochdale, span 26ft. (Mr. S. Sydney Platt, M.I.C.E., borough engineer); river covering at Bridge Mills, Middleton, Yorkshire. *Road Construction.*—Saltley Road widening, Birmingham (Mr. John Price, M.I.C.E., city engineer). *Quays and Jetties.*—River quay wall, Cullercoats, Newcastle-on-Tyne; Caledon Jetty, Dundee (Mr. J. Thompson, M.I.C.E., engineer); ferro-concrete piling, Woolmer Forest. *Reservoirs.*—500,000 gallon covered service reservoir at Nuneaton (Mr. F. Cook, engineer). *Building Construction.*—Complete chocolate factory buildings, York, for Messrs. Rowntree & Co. (Mr. W. H. Brown, architect, York); buildings for the Associated Portland Cement Manufacturers (Mr. H. O. Cresswell, F.R.I.B.A., architect); new factory at Harrow for Kodak, Ltd.; business premises, Dublin, for Messrs. Hely, Ltd. (Messrs. Batchelor & Hicks, architects, Dublin); new dyeing and cleaning works, Belfast, for the Monarch Laundry, Ltd. (Messrs. Batchelor & Hicks, architects); floors and roofs of new works for Messrs. Steiner & Co., Ltd., calico printers and dyers, Accrington; floors, Horsforth Sunday school, Horsforth, near Leeds.

GLOUCESTER HOUSE FLATS, IN COURSE OF ERECTION AT THE CORNER OF PARK LANE AND PICCADILLY, LONDON.
T. E. COLLCUTT F.R.I.B.A., AND STANLEY HAMP, A.R.I.B.A., ARCHITECTS.

The photograph reproduced above of this steel-frame building now in course of erection was taken on May 16th. In our issue for March 28th last we published the grillage foundation plan and other photographs of the steelwork taken at earlier stages. The photograph above will, on comparison, show the progress made. The steelwork, as will be seen, has now reached the fourth-floor level on the Piccadilly front of the building. The contractors for the steelwork are Messrs. Drew-Bear, Perks & Co., Ltd., of the Battersea Steelworks, Wellington Road, London, S.W.

Portion of wall with shuttering in position.

CONCRETE RETAINING WALL AT THE NEW "MORNING POST" BUILDING, NOW IN COURSE OF CONSTRUCTION IN ALDWYCH, LONDON. MEWES AND DAVIS, ARCHITECTS.

The above illustrations show the construction of the retaining walls at the new "Morning Post" offices, a steel-frame building which is now being erected by the Waring-White Building Co. We published the basement, ground and first-floor plans with elevations of the building in our issue for February 7th last. These retaining walls embody some new features in design. The toe of the wall gives increased resistance to sliding, and the stairions being placed upon the foot of the walls give additional stability. The photograph shows how the ground in the middle of the site is left to support the strutting, and how a brick wall is first built against the soil, and is then waterproofed with mastic asphalt, and the concrete afterwards deposited in the shuttering. The danger of letting in the street, by reason of the proximity of the tunnel through which the L.C.C. trams run, and the Gaiety Theatre and Hotel, necessitated great care in the work, and only small portions at a time could be constructed. An efficient bond between the different lengths has, however, been obtained by leaving a V-shaped groove at each junction. The engineer for this work, and also for the steel skeleton, is Mr. S. Bylander, who designed the steelwork for the Ritz Hotel, London.

Detail of construction of wall.

REINFORCED CONCRETE SYSTEMS.**I.—The Columbian System.**

THE Columbian system of reinforced concrete construction was invented and patented in America by Mr. C. A. Balph, Pittsburg, Pa., U.S.A., and introduced into Great Britain by Mr. J. D. O'Brien. In its initial stage it was exclusively confined to the construction of fire-resisting floors and roofs, but as the possibilities of its adaptation were realized its employment was extended, and is now applied in the erection of almost all kind of constructional works, such as floors, roofs, vertical and sloping walls, retaining walls, reservoirs, tanks, culverts, sewers, high-pressure water-pipes, silos, stairs, bridges, girders, columns, &c.

The system was largely employed in America previous to its introduction into England. To enumerate all the large buildings in America in which the Columbian system of floor and roof construction has been adopted would be no light task, but among the most important the following may be mentioned:—Block of wool warehouses for the Boston Wharf Co., Boston, Mass. (one the largest fireproof warehouses in the world, containing 520,000 sq. ft. of fireproof floors); Massachusetts Fireproof Storage Warehouse, Boston, Mass.; Washington County Court House, Washington, Pa.; factory for American Soda Water Fountain Co., Boston, Mass.; residence of Mr. F. W. Vanderbilt, Hyde Park on Hudson; and Hudson Warehouse, New York, U.S.A.

Introduction into England.

The system was introduced into England about seven years ago, since when it has been extensively used in some of the largest and most up-to-date buildings in London and the provinces. Among the most important buildings in London in which the floors and roofs have been constructed on the Columbian system by the Columbian Fireproofing Co., Ltd., of 37, King William Street, London, E.C., are:—Ritz Hotel, Piccadilly; Messrs. Waring & Gillow's new premises, Oxford Street; The Shipping Combine Offices, Cockspur Street, S.W.; the generating and distributing stations of the Charing Cross and Strand Electricity Supply Corporation, Ltd.; Messrs. Macfarlane, Lang & Co.'s biscuit factory at Fulham; Messrs. Harrold's depository, Barnes; Chelsea generating station for the Underground Electric Railways Co. of London, Ltd. (in which the system was adopted in the construction of the coal bunkers, as well as the roofs, some of the floors, &c.).

The Standard Floor.

The standard Columbian floor consists of a flat slab of concrete reinforced with the Columbian steel ribbed bars laid parallel in and completely embedded by the concrete and extending from support to support. The bars are of structural steel and rolled to the following sections:—5 ins., 3½ ins., 2½ ins., 2 ins., 1½ in. The adoption of these sections of bars for floor reinforcement has been more than justified by the results obtained. A Columbian floor combines with resistance to fire great tensile as well as compressive strength; it has a comparative high degree of elasticity, so that it can be deflected considerably without fracture, a property of the utmost importance in a floor. Failures of Columbian floors under the loads they have been designed to carry have never occurred; in fact, instances have occurred where the floors have been subjected to loads seven or eight times as great as the load they were meant to carry, the only result of such abnormal loading being deformation of floor and tearing apart of the concrete on the tension side. Failure cannot occur until the steel bars are stressed beyond their elastic limit or the concrete crushed on its compressive side. The elongation which the concrete itself can stand

without cracking is increased by the reinforcement with the Columbian bars.

The heaviest section bar (that is, the 5 in. bar) is used for very long spans of from 16 ft. to 20 ft. in length, or where an extra strong floor is required. A floor reinforced with this bar is usually from 7 ins. to 8 ins. thick, and is suitable for very strong warehouse floors, when the floor is subjected to heavy loads rapidly applied. The lightest bar is the 1½ in. cruciform section. In very exceptional cases heavier sections can be employed if required.

Spans Possible.

Columbian floors can be constructed in spans up to 20 ft., the thickness of concrete and size and spacing of bars depending on the span of the floor—that is, the clear distance between the supports—also upon the weight per ft. super. the floor will have to carry.

Very exhaustive and elaborate tests have been made with Columbian floors of different spans reinforced with bars of the different sections embedded in different thicknesses of concrete, and from these tests have been drawn up tables of actual results obtained both for live loads and ordinary dead loads; from these tables the most economical section for any required floor can be accurately determined, the result being more satisfactory than any theoretical calculations.

The floors, when erected between wall bearings, consist of rectangular slabs of concrete reinforced with Columbian bars, the floor being supported at walls by a chase about 3 ins. deep in the walls. This is the simplest method of construction, and gives very satisfactory results.

The two other methods of floor construction most commonly employed are the panelled construction and the double construction.

Panelled Floors.

The panelled system of construction is employed when the floors are carried by rolled steel joists or girders. The method of construction is as follows:—The necessary centering is first erected between the girders carrying the span of floor, and the steel bars are then suspended between the girders by steel stirrups hung over the top flanges of the girders, the length of leg of stirrup being regulated so as to allow at least ¾ in. thickness of concrete under the bars. The concrete, which is composed of the best Portland cement, sand and crushed furnace clinkers or other aggregate, well mixed wet and dry, is then filled in to the requisite thickness and tamped in position. The floors are generally finished level with the top flange of girders, and may be battened to take ordinary wood finish or screeded for asphalt, &c. The girders are completely encased on sides with solid concrete, and the underside protected by slabs of concrete secured to bottom flanges of girders with concealed anchors. These slabs are made with air-spaces for ventilation. The panelled method of construction is largely employed, and is capable of being used with decorative effect.

Double Floors.

The double construction is used when the ceiling is required to be kept the same level throughout, or where a perfectly soundproof floor is required. The floor is formed the same as in panelled construction, but instead of the joists projecting between the ceiling-line a separate ceiling is constructed by laying 1½ in. bars on the lower flange of joist and embedding them in 2½ ins. thickness of concrete. An interior centering is erected on the concrete ceiling to carry the floor, and after the floor is in place the centering is removed through an opening purposely left in the ceiling, the opening afterwards being filled in with a slab of concrete moulded to a special shape to fit the opening. This method of double construction is only suitable for spans up to 7 ft.

Columbian bars were sometimes connected to the girders with angle connections, but

this method is now discarded, the steel bars being either suspended between the girders by the steel stirrups or laid on the top of the girders. The stirrups in which the bars are suspended are made in different sizes to suit the bars, and the legs of the stirrups are punched to suit the section of bar it is required to carry.

Fire-resistance.

Apart from the economical and simple construction of the Columbian floor, its chief advantage lies in its great strength combined with its fire-resisting qualities. A floor on the Columbian system was tested at the British Fire Prevention Committee's testing station at St. John's Wood. The ceiling and floor tested were subjected to great heat, the highest temperature recorded being 2,335 degs. Fahr. Water was applied through a ½ in. nozzle, the pressure ranging from 25 lbs. to 30 lbs. at the pump. After the test the floor and ceiling were examined, and the whole of the concrete of the floor and sides of the beams were found sound and good, not disintegrated at any point. The full report of the test can be had on application to the Columbian Fireproofing Co., Ltd., 37, King William Street, E.C.

Roof Construction.

The construction of roofs on the Columbian system may justly be said to illustrate the adaptability of the system, as there is really no form of roof which cannot be constructed on this system. In flat roofs the construction is identical with that of the floors, but in steep sloping roofs the Columbian bars take the place of rafters and the concrete is filled in between them. In domes and vaulted roofs the bars are bent to the required shape, and form the skeleton framework to take the concrete filling. In sloping roofs with purlins the method of construction is somewhat different, the roof being composed of moulded slabs of concrete 3 ins. to 4 ins. thick, reinforced with 1½ in. Columbian bars; these slabs are merely laid between the purlins and the surface of the slabs is then screeded and asphalted to render the roof weather-proof. Dormer windows, openings to skylights, lanterns, &c., can be constructed with great facility on the Columbian system, the trimming, &c., being done by employing Columbian bars bent to required shapes and cleated together.

In Walls.

In vertical walls constructed on the Columbian reinforced concrete system the framework of Columbian bars is first constructed with all trimming for window-openings, &c.; vertical centering is then erected on both sides, and the concrete filled in between and well tamped. The surface of the walls is left ready to receive any desired finish.

In the construction of reservoirs, retaining walls and other similar structures on the Columbian system of reinforced concrete, the reinforcing is of Columbian steel bars, either of the sections described under floors or of any special requisite section. The method of calculation adopted is similar to that usually applied to such structures. A reinforced concrete reservoir for the Skegness Water Co. is now being erected, the whole structure being monolithic, with walls, roof, girders and columns all constructed in concrete reinforced with Columbian bars.

The Company also has acquired the rights of the Bonna system of constructing pipes in reinforced concrete, in which bars of a cross-section similar to the Columbian bars are wound spirally inside and out of a sheet of steel, the sand and cement-concrete or mortar embedding these bars inside and out. An 18 in. water main with a working pressure of 150 ft. head is now being constructed for the corporation of Swansea. Some of these pipes have been tested by Mr. R. H. Wyrill, engineer to the corporation, to over 450 ft. head, without showing the least sign of leakage. This contract was secured in competition with cast-iron pipes.

The Cost of London Schools. An important report was submitted at yesterday's meeting of the London County Council dealing with the cost of erecting public schools in the London area. Discussion has recently taken place with respect to what has been thought to be the excessive cost of recently erected schools, and the Education Committee have reviewed the whole history of the present system. Their report shows that before the late

London School Board appointed its own architect various architects were engaged, and the first thirty schools were erected in this way. The code of the Education Department and the requirements of that day were only elementary, so that these schools were inefficient in many respects. The staircases were long, steep and narrow. Cloakrooms were insufficient or wanting. Teachers' rooms were practically unknown, whereas both head teachers' and assistant teachers' rooms are now provided. The classrooms were of unsuitable sizes, and scholars sat for the most part with their backs to the windows. Most of the rooms were passages one to another, sites were small, and playgrounds insufficient. In 1883, some time after the School Board had appointed its own architect, the importance of left-hand lighting began to be recognized, and changes were made in the plan. About 1888 it was decided, in view of the large maintenance account for repointing of exterior walls and in painting interior walls, that cement should be used in lieu of lime mortar, and that internal walls of staircases, corridors, dadoes, classrooms and halls should be faced with glazed bricks—points about which there has been some criticism of late. At this same time, with the increasing use made of halls for drill and public meetings, a heavier and more rigid type of floor construction than had hitherto obtained was adopted. In 1891 the Education Department so far acknowledged the utility of a hall in a school as to grant a special loan for the purpose to every school, and from this date we find the central hall being adopted generally. The form of plan thus originated is certainly a good one. Corridors are thus done away with. At this same time, namely 1891, the late School Board decided to provide drawing classrooms, and these were erected over the halls. At this same time, too, the Board began to add decorative detail with a desire to make the buildings more ornamental and less disfiguring to the neighbourhood. The present committee state that the difference of cost between buildings erected on utilitarian lines and those designed with some regard to materials, colour and style, was about 5 per cent. The committee naturally press the point that some consideration must be given to appearance. Ornament is not, however, necessary to architectural effect, and it should be of the simplest in school design. In recent years, too, the cost of the offices and drainage generally has considerably increased. Where the ground is of a treacherous nature, it is customary to use iron soil drains; glazed tile divisions are provided between each water-closet in the ranges in lieu of wood-work, which is always subject to damage, and requires periodical painting, &c. Further, single pans with separate water-waste preventers are provided in lieu of the trough and automatic flusher. The extra cost of these items alone on a school for 800 children represents about £3 5s. per

place. The cost is sometimes increased by the provision of a playground on the top of a school, in consequence of the restricted area of the site. The late School Board considered carefully the cost of erecting schools. A special committee was appointed in 1887 to investigate and report, and as a result a new specification, the joint production of Mr. Ewan Christian and Mr. T. M. Rickman, was adopted. In 1892 a competition was held. The object was the planning of a school for 1,200 children capable of being erected on any ordinary site. Sixty-one designs were submitted, but Mr. Macvicar Anderson, the assessor, reported that it had produced no novel treatment in respect of plan that had been deemed worthy of approval. A 1903 investigation seems to have established the fact that it is cheaper to build a school in two separate blocks consisting of a two-floor building for the graded school and a one-floor building for the infants' department, than in a single block of three or four floors. As a result, the new L.C.C. elementary schools are being erected on the two-block plan, where the site is of sufficient size. By reason of the Board of Education refusing to sanction the erection of a building slightly in advance of actual and immediate requirements, central halls are erected of full size with only a portion of the eventual accommodation for scholars; this forms a larger proportion of the total cost at first than it does when the whole of any particular scheme is completed. The cloak-rooms, teachers' rooms, lavatories, &c., have also similar effect. The cost of site also varies considerably. The Education Committee therefore think that the true test of the cost of a building is its cost per foot cube on the main building, and not on the total cost of the whole school. The cost on this basis seems to have been in the last three years about 6½d. to 7d. for one-storey buildings, and from 7½d. to 8½d. for two- and three-storey buildings. Although the general tenour of the committee's report is defensive and of a *non possumus* character, the criticisms that have been made seem to have been of some utility, for the conclusions the committee come to show that they have learnt how to effect some considerable economies. Thus the use of iron drains will be abandoned, except where drains pass through made-up ground or under buildings. Wood-block flooring will be confined to halls and corridors only, and floors be made by nailing boards on to fillets on the concrete. The playsheds will be simplified in construction and reduced in cost by the use of iron columns. The standard pattern of sashes and fittings, together with the substitution of cords, pulleys and quadrant stays for the present metal window gearing, will be provided for. The low-pressure hot-water apparatus is being cheapened. Art and drawing classrooms will be omitted, carving and needless embellishments reduced, special patented articles excluded from the specifications, &c.

HIGH BAY OF CHOIR, LIVERPOOL CATHEDRAL. G. GILBERT SCOTT, ARCHITECT. (R.A. Exhibition, 1905.)

[NOTE.—The portion of Liverpool Cathedral first to be erected comprises the Lady Chapel, chapter-house, the choir up to the crossing, and the eastern vestries; the contract for this work, amounting to £370,000, has been let to Messrs. Morrison & Sons, of Wavertree, Liverpool. The nave and great twin towers are to be completed later. The total cost of the cathedral will be £750,000, towards which £275,000 has been given or promised.]

KING'S NORTON SCHOOL COMPETITION.

IN the competition, just decided, for an elementary school to be erected at King's Norton, Selly Oak, Birmingham, fifty-two designs were submitted, and a selection of eleven plans was set aside by the assessor (Mr. H. T. Sandy, of Stafford) for the inspection of the committee and competitors. The difficult problem which the architects had to solve was the disposal of the buildings on the site so that they did not interfere with the lighting of the existing temporary premises facing Umberslade Road. At the same time adequate playground accommodation and the proper aspect of the classrooms added further interest to the planning of the scheme, which, taken as a whole, is best solved by the winning design.

Many designs altogether ignore the fact that classrooms arranged parallel to, or nearly so, and facing the north-west boundary, would never get any direct sunlight during the winter months, and in the summer only after four o'clock in the afternoon. As sunlight is so essential for the health of children, and as in this climate there are so few days when it is inconveniently powerful, this question of aspect has influenced the assessor to a great extent in making his award.

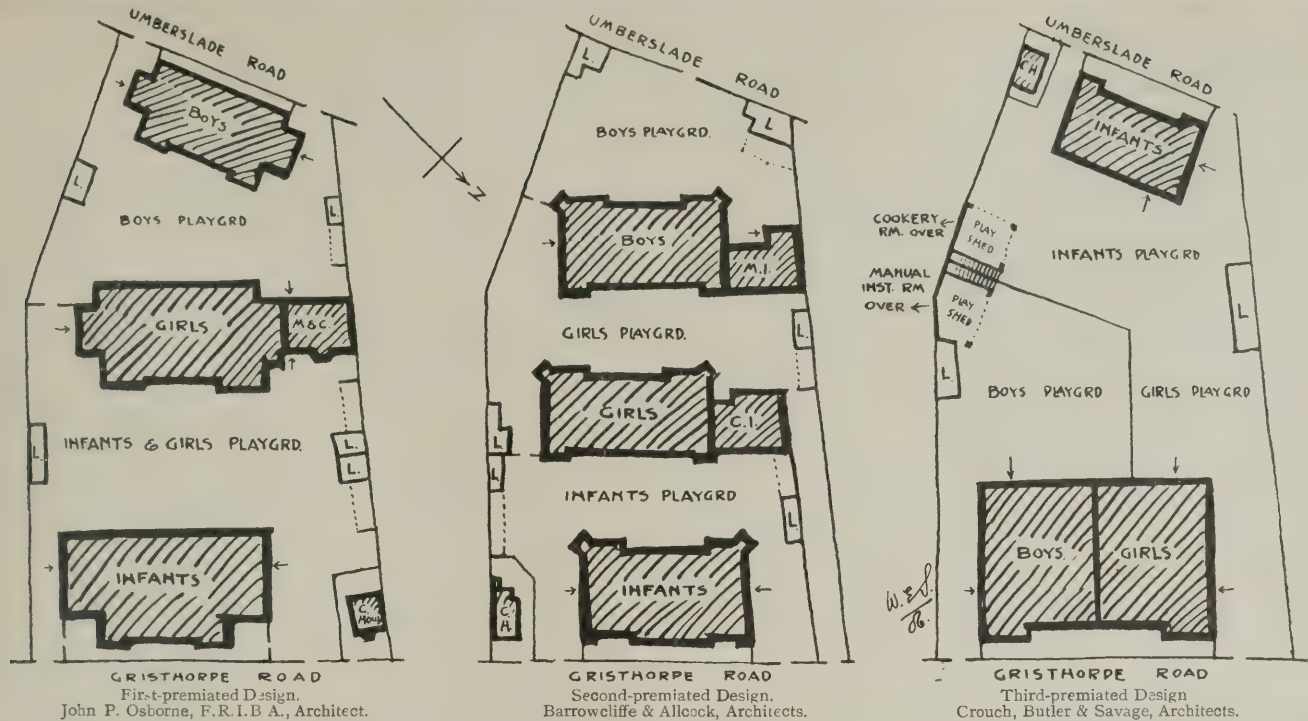

Another equally important point, which placed many competitors out of the final selection in this competition, was the disposal of the buildings on the site so as to allow the retention of the present temporary schools during the erection of the new infants' school. Some have apparently been oblivious of the fact that they were destroying the utility of the temporary buildings by blocking out the light, and thus, while fulfilling the letter of the instructions, ignoring their spirit.

A question in the replies to queries which misled many architects was the one relating to right of light over adjoining property. Some of the plans which required light along the whole or part of the side boundary were disqualified on this account.

The result of the competition is highly satisfactory to all concerned. The various difficulties connected with the site and buildings necessitated careful study on the part of the assessor, as many of the schemes display a good knowledge of school planning.

Design placed First.

The assessor has awarded the first premium to Mr. John P. Osborne, F.R.I.B.A., of Birmingham. This scheme permits of the erection of the infants' school without interfering in any way with the existing temporary buildings, and without depriving them of any light. It also similarly permits of the erection of the girls' school. The plan solves in a simple manner one of the most difficult problems submitted to competitors. It has one drawback, which some of the other designs are free from, caused by the three distinct school buildings cutting up the playgrounds. This creates a narrow space, comparatively speaking, between each school block, and the sunlight will be intercepted at times to a slight extent, and some of the blocks will also be shadowed because of this grouping on the site. The playgrounds are very well supervised. In detail the general arrangement of the plans is excellent, and although the whole of the classrooms do not lead directly from the central hall there are only two in each block which are not supervised therefrom. The entrance corridors, unless divided by a porch or screen, will be decidedly draughty—only one pair of doors is shown, and these open both ways instead of outwards only. The position of the lavatories does not add to the appearance of the corridors, and in practice would look

unsightly. As the corridors are only slightly over 7ft. wide they could easily be widened, with advantage, where the cloak-rooms are shown, because of the traffic when the school is breaking up. The elevations are quietly treated with stone quoins well placed to relieve the brickwork. The wood ventilating turret looks heavy and could be designed in a lighter and more graceful manner. There is no doubt about the building, as shown by the drawings, being erected for the sum stipulated in the conditions, namely, £14 per head.

Design placed Second.
This position has been awarded by the assessor to Messrs. Barrowcliffe & Allcock, of Loughborough. It is similar in many respects to the winning scheme, both in disposition on the site and in the working-out of the plans, and it has the same objections—namely, the narrowness of the playgrounds and the interception of the sunlight. In the infants' school supervision has been obtained for all classrooms from the central hall. The elevations show a fair amount of detail, but the design is not so satisfactory.

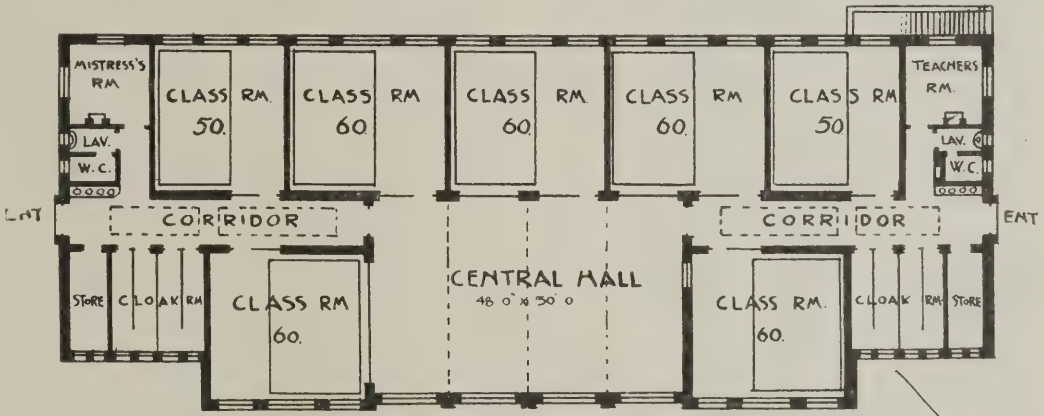

The design placed third, by Messrs. Crouch, Butler & R. Savage, of Birmingham, shows an admirable arrangement on

the site for sunlight and ventilation of the playgrounds, and the feeling of openness is a strong factor in its favour. The aspect of the classrooms and some points in the plans required more consideration than was accorded to them, but otherwise in many ways this runs the first design closely.

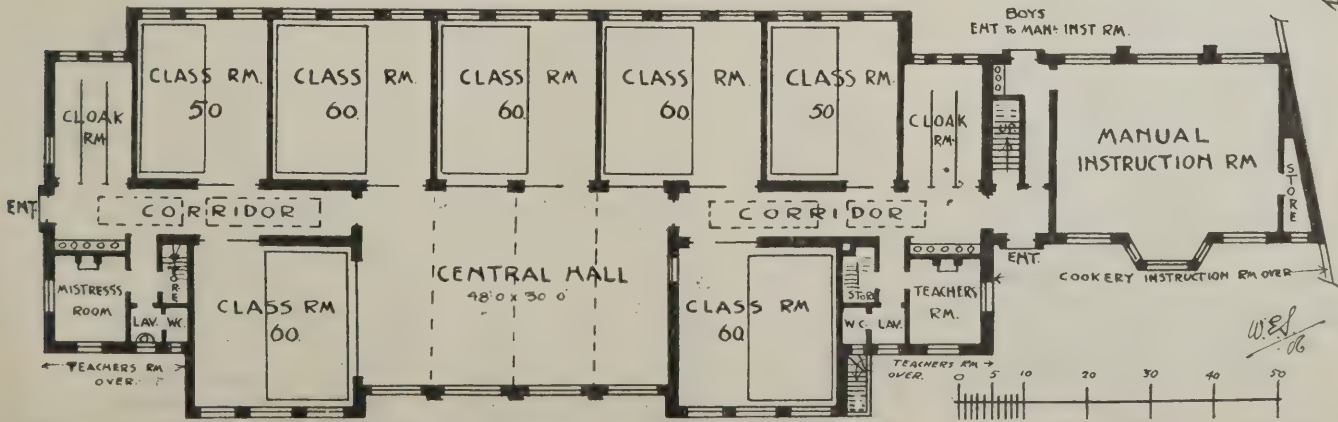

Messrs. Farmer & Beveridge, of Liverpool, submitted a very compact girls' and boys' school, with the infants' school arranged in the centre of the site; many competitors followed the same arrangement, but in the

working out this was one of the best designs exhibited.

Some sets of drawings were excellently coloured, and the standard of design and draughtsmanship was much better than in recent competitions. Mr. G. McMichael and Messrs. Cossins, Peacock & Bewley, of Birmingham, submitted well-got-up sets, especially in colour. Other well-known firms in the final selection and mentioned by the assessor were Messrs. Oliver & Dodgshun, of Leeds; Bower & Parsons, of Birmingham; and Salomons & Steinthal, of Manchester.

Plan of Infants' School.

Plan of Girls' School. (Boys' School similar.)

NOTES ON COMPETITIONS.

Nursing and Convalescent Home, Glossop.

In the town of Glossop, north of the Peak of Derbyshire, lives a benefactor who has presented the Corporation with £30,000 with which to build and endow a nursing and convalescent home. Judging by the set of conditions which accompanies the invitation for competitive designs, the Corporation appear to be somewhat embarrassed by the money thus placed at their disposal, and in order to obtain a happy issue out of their affliction they seek to place the onus upon the shoulders of long-suffering competitors. That at least is the conclusion arrived at by the writer of these remarks after a treble perusal of the requirements. These state that designs are to be "accompanied by particulars of a scheme as to the number of patients and nurses to be accommodated and the expense of maintenance," &c. ("particulars" and "scheme" are underlined in the original). "Particular regard must be had to the fact that the Corporation intend that the sum of £30,000 shall effectually provide for the erection and completion of the building, and also for the furnishing and decorating, and the laying out of the grounds, and leave a sum which, if invested in authorized trustees' securities, will provide a sufficient sum for the endowment of the institution, i.e., for the ground-rent, maintenance of the buildings and upkeep of the grounds and the carrying on of the institution so that no subsidy shall be requisite out of the rates." The cost of the building, with its decoration and furniture, as well as laying out the grounds, must not exceed £6,000. The ground-rent of the site is given as £42 per annum. This ground-rent is the only tangible sum which the harassed architect has to deal with, for the £6,000 will have to be carefully adjusted between furnishing, gardening and building. The process by which the desired result must be arrived at may be roughly stated as follows:—(a) The architect makes careful enquiries as to the cost of furnishing and laying-out of grounds, and adjusts the size of his building according to the result. (b) The architect then makes further careful enquiries as to the value of authorized trustees' securities, wages of nurses, matron, staff and gardener, cost of edible commodities in Derbyshire, fees of medical attendant, value of depreciation of stock, and the hundred and one items so difficult to estimate accurately even for a business man who desires to arrange in advance how a fixed income may be lived up to. Inevitable result—the annual outlay arrived at per b, when multiplied by the accommodation provided by the plan, proves either too great or too small, and another plan will have to be schemed. And what is the hope of reward for these herculean and unheard-of labours? The designs and schemes will be judged by a lay committee, who may call to their assistance such advice as they think proper; the two selected designs will become the property of the Corporation, who will pay a premium of £20 to the author of the design placed first by the committee, and £10 for the one placed second. The Corporation do not bind themselves to have the first or any of the designs executed. Comment is needless.

"The competition is open to all architects."

Proposed New School at Consett.

Particulars of this unsatisfactory competition were given in this column last week. In reply to a request that an assessor should be appointed, the secretary of the Durham Education Committee has replied that the Committee have upon their staff an architect who advises them upon all questions relating to plans and buildings. This reply was expected, for it has been made before by the same authorities. The Education Committee have been informed that the architect in

question cannot be regarded as an assessor, for his position is such that his opinion may be outweighed by members of the Committee who may have a predilection for a particular design. It is on record that this occurred in a former competition. It has been urged that a fully-qualified professional assessor, who shall be an expert in schools, is especially necessary in this instance by reason of the very scant information contained in the conditions, and that he should be appointed at once to be able to frame the answers to competitors' questions.

School at Newmains.

For a new school for 900 pupils at Newmains, near Wishaw, competitive plans have been sent in by four architects. The estimates varied from £8,839 to £9,545.

Kirkintilloch Conservative Club.

From information we have received, it appears that the competition for proposed new club rooms for the Kirkintilloch Conservative Association, has been decided in a very unsatisfactory manner. When giving notice of the competition some time ago, we referred to the conditions as being not at all what they should have been—no premium being offered, no site plan furnished, and the Association not binding themselves to accept any one of the designs submitted. We understand there were twenty-eight competitors, some with alternative plans, making a total of thirty-six sets. These were reduced to a short list of three, and were forwarded, together with a specification of the materials to be used, to a firm of measurers in Glasgow for a report on the cost. According to the schedule of conditions the cost of the building was not to exceed £1,800. The names of the architects in the short list were Mr. Frank Southern, Mr. William Baillie and Messrs. J. W. and J. Laird. The result of the measurers' estimating was that Messrs. Laird's plan was the only one which complied with the conditions in the matter of cost, being £60 below the sum stipulated. At the next meeting of the committee the list was reduced to two—Mr. Baillie and Messrs. Laird, but as Mr. Baillie's plans turned out about £200 in excess of the amount stipulated in the conditions, he was given back his drawings to alter and bring down his cost, though we understand that, even as amended, it is still over £1,800. In a good many competitions of course the cost is exceeded, but in this case, before the competition was decided on, plans were drawn out to order of the committee by an architect, and were thrown over for the reason that they cost £300 too much. The secretary of the building committee was most emphatic in stating that plans over £1,800 would on no account be considered. But with Mr. Baillie this seems to have been allowed. The following are some particulars of his design:—The building, which is to be of three storeys with basement, will occupy a prominent site at the corner of the High Street and the Backcausway. The front facing the High Street will be built of square rubble, with dressings of polished sandstone. On the ground floor are a well-lighted reading-room and two large committee-rooms—all three divided by folding partitions, so that the whole of the ground floor may be thrown into one large hall to accommodate about 300 persons, with ante-room and lavatories, an exit from the hall being arranged to the Backcausway. The first floor comprises a summer ice room for two tables and a large card-room, as well as caretaker's rooms and kitchen. On the top floor is a billiard-room having accommodation for four tables, with a bay window at each end, well lighted from the roof. Suitable lavatory accommodation has been provided on each floor. The total cost of the building including furnishings, &c., will amount to over £2,000. The work is to be proceeded with at once.

Competitions Open.

The following is a list of competitions open:—

DATE OF DELIVERY.	COMPETITION.
May 31	CHAPEL AND SCHOOLROOM AT MANSELTON, SWANSEA. Particulars from Mr. T. Roberts, 71, Brynhyfryd, Swansea.
June 26	NURSING AND CONVALESCENT HOME AT GLOSSOP, to cost £6,000. Premiums of £20 and £10. Particulars from Mr. T. W. Ellison, town clerk, Norfolk Chambers, Glossop.
" 30	ELEMENTARY SCHOOL AT EAST WEMYSS. Particulars from Mr. A. Watson Taylor, clerk to the School Board, East Wemyss, R.S.O., Fifeshire.
July 2	SECONDARY SCHOOL FOR GIRLS AT AIGBURTH VALE, for the City of Liverpool Education Committee. Limited to architects in Lancashire and Cheshire. Particulars from the Town Clerk, Municipal Offices, Liverpool.
" 4	SCHEME OF SEWERAGE AND SEWAGE-DISPOSAL WORKS AT WARBLINGTON. Premiums of £100 and £50. Particulars from Mr. J. W. Loader Cooper, clerk to the U.D.C., Queen Street, Emsworth.
Oct. 1	ALPHABET COMPETITION. Prizes of £20, £10 and £5. For particulars see "Architectural Review."
" 31	BOURSE AT CAIRO. — Premiums of £250 and £100. International competition. Designs to be submitted to the "Corporation des Agents de Change," Cairo, Egypt.
Date not yet decided upon.	NEW MUNICIPAL BUILDINGS AT STIRLING (to cost £12,000). Premiums of £100. Particulars from Town Clerk, Borough Buildings, King Street, Stirling.
No date	DETACHED AND SEMI-DETACHED HOUSES AT CLIFTONVILLE, BELFAST.—Premiums £700. Particulars from R. J. McConnell & Co., 51, Royal Avenue, Belfast.
"	SCHEME OF DECORATION for the interior of Cambridge Hall at Southport. Premium £5 5s. Particulars from Mr. J. Ernest Jarratt, town clerk, Town Hall, Southport.

THE FORTHCOMING CONGRESS OF ARCHITECTS.

Provisional Programme.

THE following is the provisional programme of the seventh international congress of architects to be held in London from July 16th to 23rd:—

Monday, July 16th.—Reception at Grafton Galleries at 10 a.m. and inaugural meeting at the Guildhall at 3 p.m. Soirée at the Royal Academy.

Tuesday, July 17th.—Congress meeting in the morning. Visits to Hatfield and Hampton Court in the afternoon. Conversazione at the Mansion House in the evening.

Wednesday, July 18th.—Congress meeting in the morning. Visits to Buckingham Palace Gardens, Westminster Abbey, Messrs. Holloway Brothers' works and Messrs. Doulton's potteries in the afternoon; also reception at Lyceum Club (ladies).

Thursday, July 19th.—Congress meeting in the morning. Visits to St. Paul's Cathedral, the Temple, the Institute of Chartered Accountants, St. Bartholomew's, Kensington Palace, Dorchester House and Windsor Castle in the afternoon. Evening fête at the Royal Botanic Society's Gardens in Regent's Park.

Friday, July 20th.—All-day visits to Oxford and Cambridge, and other visits to the Tower of London, South Kensington Museum and the Royal College of Science. Evening reception by Art Workers' Guild.

Saturday, July 21st.—Visits to Bridgewater House in the morning and to the Houses of Parliament, Westminster Cathedral and Greenwich Hospital in the afternoon. Farewell banquet at the Hôtel Cecil in the evening.

Exhibitions.

There will be the following exhibitions at the Grafton Galleries:—Photographs of buildings executed by living British archi-

fects; a chronological exhibition of British architecture from the Norman Conquest to the death of Sir Charley Barry (1860); oil paintings and water-colour drawings of English architecture; and a few choice specimens of British furniture and silver work: while at the premises of the Architectural Association in Tufton Street, Westminster, there will be exhibited a selection of Viennese students' drawings arranged by Prof. Otto Wagner, of Vienna.

Subjects for Discussion.

The Executive Committee have received the following communications (from this country where not otherwise stated):—

1. *The execution of important Government and municipal architectural work by salaried officials*.—M. F. Blondel (France), Society of Austrian Architects, Gaston Trélat (France), Oscar Simon (Société Centrale d'Architecture de Belgique).

2. *Architectural copyright and the ownership of drawings*.—George Harmand (France), H. H. Statham, Gaston Trélat (France).

3. *Steel and reinforced-concrete construction*.—The Joint Committee on Reinforced Concrete, Herr Wilemanns (Austria), Prof. Henry Adams, E. P. Goodrich (America), Louis Cloquet (Société Centrale d'Architecture de Belgique), Joaquim Bassegada (Spain), Gaston Trélat (France).

4. *The education of the public in architecture*.—John Belcher, T. G. Jackson, Arthur Hill, Othmar von Leixner (Vienna), Herr Muthesius (Berlin), Banister F. Fletcher, Francisco del Villars y Carmona, Manuel Vega y March, Eduardo Mercader y Saccamella (Spain), Society of Austrian Architects, Gaston Trélat (France), Gaston Anciaux (Société Centrale d'Architecture de Belgique).

5. *A statutory qualification for architects*.—Robert Walker, John S. Archibald (Canada), L. Bonnier (France), Society of Austrian Architects, Gaston Trélat (France).

6. *The architect craftsman: How far should the architect receive the theoretical and practical training of a craftsman?*—Reginald Blomfield, Prof. W. R. Lethaby, J. M. Poupinel (France), Fr. van Gobbelschroy (Société Centrale d'Architecture de Belgique), Society of Austrian Architects, Gaston Trélat (France).

7. *The planning and laying out of streets and open spaces in cities*.—Raymond Unwin, Herr Stübgen (Germany), E. Hénard (France), B. Polles y Pivo, J. Majó y Ribos, M. Bertran de Quintana (Spain), C. H. Buls (Société Centrale d'Architecture de Belgique), Gaston Trélat (France).

8. *To what extent and in what sense should the architect have control over other artists or craftsmen in the completion of a national or public building?* Sir W. B. Richmond, H. P. Nénot (France), C. B. Müller (Germany), Association of the Architects of Catalonia (Spain), Society of Austrian Architects, Gaston Trélat (France).

9. *The responsibilities of a Government in the conservation of national monuments*.—Prof. G. Baldwin Brown, A. Besnard (France), Gaston Trélat (France), Joseph Artigas y Ramoneda (Spain).

10. *The organisation of public international architectural competitions*.—J. Guadet, Society "Architectura et Amicitia" (Holland), Gaston Trélat (France).

The Executive Committee have also arranged for Professor Meydenbauer, of Berlin, to read a paper on "Messbildverfahren" or "Photometry." A communication on this subject has also been received from M. Marcel le Tourneau, of Paris.

M. Honoré Daumet (Paris) will read a communication on the Château de Saint-Germain.

Mr. Cecil Smith (Keeper of Greek and Roman Antiquities, British Museum) will read a paper on "The Tomb of Agamemnon."

THE NEW VAUXHALL BRIDGE.

THE new bridge across the Thames at Vauxhall, after being under construction for 7½ years, was opened on Saturday last. It replaces a structure opened in 1816 and finally dismantled in 1899.

The new bridge forms, on the Westminster side, a roadway over the river in continuation of Vauxhall Bridge Road, and on the Surrey side joins South Lambeth Road, facing Upper Kennington Lane. Its abutments and piers are faced with granite blocks, which have cores of concrete and stone. The steel and iron superstructure comprises five spans. Between abutments the length is 759ft 4ins. and the width between parapets 80ft., divided into a carriageway and two footpaths, the former 50ft. wide and the latter 15ft. each.

The Steel Spans.

The centre span is 149ft. 7ins. wide, with a headway of 20ft. above high-water; the two intermediate spans joining it on either side are each 144ft. 4½ins. wide, with headways of 19ft.; whilst the two shore spans, which at the land ends link on to the abutments, are each 139ft. 5½ins. wide, with headways of 14ft. 11ins. The five arches have thirteen ribs each, which bear on steel skewbacks built into the abutments or resting on the piers. These skewbacks, both the two single ones joining on the abutments and the four double ones linking the ribs to the piers, are particularly heavy members of the whole design, nearly 300 tons of steelwork having been put into them. In addition, other steelwork used in the superstructure—namely, for the arched ribs and bracings, the spandrels, framings of the arches, and hinge pins—amounts to over 3,433 tons, whilst there is cast-steelwork weighing 250 tons, 110½ tons of wrought-iron, and 166½ tons of cast-iron. Where the steel-plate decking is not laid directly on the ribs or on the steel framing of the piers, longitudinal rolled steel joists carry it, borne by stanchions, also of rolled steel, which stand on the ribs.

Piers.

The two central piers are each 15ft. 8ins. wide, and the two intermediate ones 14ft. 8ins. at the level of Trinity high-water. The four piers are all alike save for this difference in height, which was made to suit the gradients of the roadway. Three of the four were constructed with no more difficulties than those ordinarily incident to similar operations on a river with so great a range of tide as the Thames. The Westminster central pier, however, gave considerable trouble almost from the beginning, the various mishaps culminating in the complete collapse of the dam erected round it in the autumn of 1902, which seriously interfered with the work of erecting the superstructure until the dam was made tight again. The foundations, which are of 8 to 1 concrete, with a width of 37ft. and 38ft. in the side and centre piers respectively, and 140ft. 9ins. and 142ft. 6ins. in length overall, are cased in tongued and grooved sheet-piling, being the lower ends of the dam piles, which were cut off at the top of the concrete base and left in when the piers were built. The ends of the piers are finished with cutwaters, capped with carved granite blocks. A moulded cornice, similar to the cornices on the abutments, terminates the granite facings of the piers below the steel skewbacks of the arches, where the masonry ends.

The bridge has been constructed from the designs of Mr. Maurice Fitzmaurice, C.M.G., M.I.C.E., chief engineer to the London County Council, with whom has been associated Mr. W. E. Riley, F.R.I.B.A., superintending architect to the Council, in respect of the ornamental features of the superstructure. Messrs. Pethick Brothers, of Plymouth, were the contractors for the substructure, and Messrs. C. Wall, Ltd., for the steelwork. The total cost has been £437,000.

THE NEW BRIDGE ACROSS THE THAMES AT VAUXHALL.
MAURICE FITZMAURICE, C.M.G., M.I.C.E., AND W. E. RILEY, F.R.I.B.A., RESPECTIVELY CHIEF ENGINEER AND SUPERINTENDING ARCHITECT TO THE LONDON COUNTY COUNCIL.

A SCOTTISH ICE RINK.

THE building illustrated on this page is proposed to be erected at Crossmyloof, Glasgow, for skating and curling, and has been designed purely with the view of utility, the provision of a good and large ice surface being considered of greater importance than elaborate design and finish in the structure. The walls are to be built with good red clay bricks, neatly pointed, and the inside treated in Hall's distemper. The roof is to be constructed of light iron principals,

covered with boarding and open slating and having stretches of patent glazing. The roof will be in two spans supported on a lattice-girder running through the centre, carried on three steel stanchions, thus minimizing obstruction to the floor area. At one end of the rink is the main entrance, with pay-office and ladies' and gentlemen's cloak-rooms, while at the other end are the caretaker's house, with bar and tea-room adjoining, and the necessary stores. The engineering department for the manufacture of the ice is at the same end of the building, as

also the lavatories. All round the rink, seats will be formed for spectators and players, underneath which will be lockers for skates, curling stones, &c. The floor under the ice will consist of a concrete foundation covered with insulating material of cork, brick or other substance coated with asphalt, which, being turned up all round, will form a tank for the water. Through this water will be run the freezing pipes, which will be designed to keep the ice always in a uniform state. The architects of the building are Messrs. Fryers & Penman, of Largs.

WARING AND GILLOW'S NEW PREMISES IN OXFORD STREET, LONDON.
R. FRANK ATKINSON F.R.I.B.A., ARCHITECT.

THE WARING BUILDING.

A Notable Addition to London Street Architecture.

IT is somewhat remarkable that in the whole length of Oxford Street and Holborn the only public edifices are a free library and a post-office, and that these are quite inconspicuous in the perspective of the street. On this account the large building now being completed for Messrs. Waring & Gillow is doubly welcome, for not only does its façade give added interest to the thoroughfare, but its imposing scale is what one looks for in a large public building. Such features of the elevation as may seem most open to objection can be traced to the successful endeavour of the architect to meet the requirements of the case. What was the problem before the architect? Presumably to provide an enormous floor area, to provide as great a superficies of window as was compatible with dignity, and to challenge attention. The first condition dictated the number of storeys, and the great depth of the galleries or showrooms entailed considerable height to each. Hence the building is somewhat too high for its length, even though the architect has merged two storeys in the roof. The pediment or "fronton" in the centre might have been omitted and the cornice left unbroken. This would have diminished the height and emphasized the length; but then the building was to challenge attention, and it does this more by virtue of its height than by anything else. We must especially notice the blocks of stone used in the pediment and elsewhere; their enormous size compels our admiration.

Again we may regret the angle bay of the first floor. It detracts from the strength of the corner, emphasized as this has been too by the use of long stone quoins above. But

this bay is part of the endeavour to meet the second requirement as to light, and so it only remains for us to appreciate the skill with which it is carried and the way in which it merges once more into the wall above. The vigorous carving of the huge granite corbels is one of the most delightful details of the building.

The ground storey has been considerably modified from the architect's perspective and model, and not without detraction from the stateliness of the structure, but the broad rusticated piers of granite remain, although at wide intervals, and we feel grateful that the pilaster-like strips usual between shop fronts have been thus concentrated.

Above, on the principal storey, the centre is recessed between columns and pilasters, the whole bearing a balcony, while on either side is a series of lofty windows with circular lights above. The lower windows have wrought-iron balconies of pleasing design, consisting of scroll-like foliage stiffened with square bars, the whole taking a graceful bulging form.

In the upper portion of the façade are square-headed windows and a series of coupled semicircular arches, within which the plane of the glazing is much recessed. The details of both are excellent in their refinement and strength, but it is open to question whether the square-headed windows should not have been at the angles of the building and the semicircular windows grouped as an arcade above the circular lights of the second storey. This would have strengthened the corner and avoided the present change of vertical axis with relation to the end windows. But even here the critic must be cautious, for the thick walls which are carried up through the roof divide the building into vertical sections connected only by fireproof doors, and these walls

might have precluded a continuous arcade on the elevation.

The colour of the building is very attractive, and is mainly due to the use of bright red rubbers set with a fine white joint for the general walling. Portland stone is used for the dressings, and the sculptured blocks are so cut as to leave the white outlines to be silhouetted against the red walling, instead of the true bonding of the blocks coming to the front in the ordinary way. The bricks rise six courses to the foot, and this enhances the scale of the whole structure, as well as emphasizing the size of the blocks of stone.

The cast-lead rainwater pipes and heads are a feature of the elevations by reason of their unusual size and beauty. The great weight of the heads has probably entailed some special means of support.

OUR PLATES.

"HARTLEY END," Hampshire, has been built lately at Winchfield. The treatment of it is similar to many old houses in the neighbourhood, the materials being red bricks and hand-made tiles. The builder was Mr. J. Harris, of Basingstoke.

The house at Highgate is now being erected by Mr. Henry Brown, of Stoke Newington, at a contract price of about £1,600. The materials of this house also are red bricks and hand-made tiles.

Mr. Arthur Keen, F.R.I.B.A., of 4, Raymond Buildings, Gray's Inn, W.C., is the architect of both houses.

Enquiries Answered.

Questions should in all cases be addressed to the Editor and be written on one side of the paper only.

Correspondents are particularly requested to be as brief as possible.

The querist's name and address must always be given, not necessarily for publication.

Concrete Domes.

REDHILL.—VETERAN writes: "(1) Please explain how rolled lead, sheet asphalt and Ruberoid should be attached to the exterior of a concrete dome, describing the procedure in each case. Also, which is the best material to use? How were the tiles fixed on some of the Byzantine domes? (2) Have the domes of the new Westminster Cathedral an asphalt covering as well as an external casing of artificial stone? (3) Is it possible to construct a concrete dome of, say, 40ft. diameter strengthened with steel rods, so as to be entirely without thrust and to admit of its being supported on thin walls (or piers) without buttressing? Have any special precautions to be taken in forming an 'eye' in same?"

If the dome is of coke-breeze concrete the materials named can probably be cut in gores and nailed to it, but the joints and nail holes would require special protection, and the writer has no experience of covering domes. A ferro-concrete dome can be constructed 40ft. in diameter in such a way as to produce dead load only without thrust. There would be nothing special about the eye for a dome of this material, beyond encircling it with embedded steel rods.

HENRY ADAMS.

San Francisco for Architects.

BIRMINGHAM.—R.I.B.A. writes: "Is there any opening in San Francisco for two young architects who are Associates of the Royal Institute? Would the fact of not being American citizens at all handicap them? As an alternative, would they have a better chance in the Eastern States or Canada?"

Ifso, which towns offer the best opportunities?"

OSWALDTWISTLE. — T. Y. writes: "To whom should I make application for a situation in an architect's and surveyor's office at San Francisco? I think no place offers better prospects."

There will no doubt be plenty of openings for architects' assistants in San Francisco in a few weeks' time, but matters can hardly have been cleared up yet. There seems to be an impression abroad that English architects could easily start private practice and secure clients, but we think this is erroneous. There are plenty of architects in California, and well-known American architects in other cities will probably secure clients and open

branch offices, so that strangers will be rather out of the running, except as draughtsmen and material agents. As regards our first correspondent, the Eastern States offer no better chances. Canada is a good field undoubtedly, especially out West. In reply to our second correspondent, appointments can only be secured by first going out and advertising in local papers and calling on local architects.

Learning the Building Trade.

LONDON. — J. G. writes: "Where could I learn the building trade from the beginning? I am just starting in the office of my father, who is in a small way of business, as builder and decorator, mostly repairs and

dilapidations being his line, which requires a little knowledge of the building trade. I am anxious therefore to attend some classes and lectures where I can obtain sufficient knowledge to be able to measure work and manage a business."

We should advise you to go to the London County Council School of Building at Brixton.

Ballroom Floor.

BOURNEMOUTH. — E. D. writes: "Please give me a few hints on the construction of a spring or hanging floor for a large ballroom."

See an article in our issue for January 26th, 1898.

Complete List of Contracts Open.

WITH a few exceptions, news of Contracts Open are not repeated after they have been published once in these columns, so that readers will find particulars in our previous issues of other contracts that still remain open.

Unless expressly stated to the contrary all deposits required for bills of quantities, &c., are returned on receipt of bona-fide tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair-wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

May 31. Thornhill. — Mason, joiner, slater and plaster work of addition, &c., to shepherd's house and offices at Achaneich, Spean Bridge. Also for mason, joiner and slater work in connection with shepherd's house and offices at Blarour, and offices at Tirndrish. Plans and specifications to be seen at the places mentioned. Offers must be lodged with James Brown, Jarbruck Lodge, Thornhill, Dumfriesshire, not later than May 31.

May 31. Carmarthen. — Conversion of Bank House into county offices and the erection of new roof thereon. Plans may be seen and specifications and quantities obtained from Charles H. Mounsey, county surveyor, Carmarthen, and W. D. Jenkins, county education architect, Carmarthen. Sealed tenders, endorsed "County Offices," must be in the hands of J. W. Nicholas, clerk of the County Council, Shire Hall, Carmarthen, on or before 4 p.m. on May 31.

May 31. St. Clears. — Erection of a new dwelling-house for Zion Baptist Church, St. Clears. Plans and specifications may be seen at 1, Station Road, St. Clears, and tenders are to be sent to John Williams, at the above address, on or before May 31, endorsed.

May 31. Ecclesfield. — Erection of the Stacey Memorial Parsonage House at Grenoside, in the parish of Ecclesfield. Plans and specifications may be seen and quantities obtained on application to R. & W. Dixon, architects, 5, Eastgate, Barnsley, to whom sealed tenders must be delivered, endorsed "Tender for Parsonage House," not later than 10 a.m. on May 31.

May 31. Truro. — Erection of new stores, &c., on the site of the old smelting works, Trafalgar Square, Truro, for W. G. Goodfellow, according to plans and specifications, which may be seen at the office of A. J. Cornelius, M.S.A., architect, Truro. Sealed endorsed tenders to be sent to W. G. Goodfellow, The Parade, Truro, on or before May 31.

May 31. Mountain Ash. — Erection of buildings to be used in connection with the Workmen's Institute, Mountain Ash, for the Committee. Plans, &c., may be seen at our Offices, 1, Jeffrey Street, Mountain Ash, or 42, Canon Street, Aberdeen. Endorsed tenders to be sent to Morgan & Elford, not later than May 31.

May 31. Sudbury. — Erection of additional accommodation, consisting of nurses' bedrooms, isolation ward, &c., at St. Leonard's Hospital. Drawings, specification and conditions may be seen at the office of the architect, Alfred Howard, Cornard Road, Sudbury, from whom further information can be obtained. Tenders, which are to be sent in by May 31, should be sealed and endorsed "Tender for Additional Accommodation at St. Leonard's Hospital," and addressed to Joseph Alexander, Esq., secretary of the St. Leonard's Hospital, Sudbury.

May 31. Bristol. — Erection of Wesley Memorial church, Bryant's Hill, Bristol. Plans, &c., may be seen any weekday from 9.30 a.m. to 4.30 p.m., on application to G. Peters, Kingscote House, Bryant's Hill, St. George, Bristol. Quantities obtained of W. Hugill Dinsley, architect, Chorley, Lancs., on deposit of 10s. 6d. Tenders to be delivered to the Rev. W. J. Clarke, Elmlyra Villa, Hanham, near Bristol, not later than noon on May 31.

May 31. Warrington. — Erection of the New Winwick Hall imbecile wards for the Lancashire County Asylum. Plans may be seen and bills of quantities obtained from the architects, Chadwick & Booth, 16, Princess Street, Manchester. Applications from contractors desirous of tendering for the general building contract, engineering, heating and ventilating must be forwarded to the architects not later than May 31.

May 31. Swindon. — Alterations and additions at Nos. 10 and 11, East Street, for the Industrial Co-operative Society. Plans and specifications may be seen at the office of R. J. Beswick, architect and surveyor, 10, Victoria Road, Swindon. Sealed and endorsed tenders to be delivered to J. L. Braud, Secty., not later than 5 p.m. on May 31.

June 1. Brighton. — Supply of Portland cement for the year ending June 30, 1907, the same to be delivered at

any of the Brighton Railway stations as ordered in quantities of from 6 to 20 tons at one time. The specification and form of tender may be obtained on application to the Borough Surveyor at the Town Hall, Brighton. Sealed tenders, endorsed "Tender for Portland Cement," must be left at the Town Clerk's Office, at the Town Hall, before 10 a.m. on June 1.

June 1. Ballymena. — Proposed extensions and alterations at Ballymena Cottage Hospital. Plans and specifications can be obtained from — Boyd, C.E. Tenders to be sent to R. R. Porter, hon. secty., on or before June 1.

June 1. Cardiff. — Erection of a new Greek Church on a site situated between the West Junction Canal and North Church Street, Cardiff. Plans and specification may be seen and bills of quantities obtained on payment of a deposit of £1 1s. Sealed and endorsed tenders, "Greek Church," to be sent to Milnside Raphael, Greek Consul, Bute Docks, Cardiff, on or before June 1.

June 1. Worcester. — Rebuilding of a retaining and parapet wall in connection with Shipston County Bridge at Shipston-on-Stour. Copies of drawings and specification and form of tender may be obtained on application to J. H. Garrett, county road surveyor, Shirehall, Worcester, to whom sealed tenders, endorsed "Retaining Wall, Shipston Bridge," are to be sent not later than June 1.

June 1. Port Patrick. — Erection of a dwelling-house at Port Patrick, in the county of Wigtown. Copies of the bill of quantities will be supplied on application to the Superintendent Engineer, H.M. Naval Establishment, Rosyth, Inverkeithing, N.B. The drawings, specifications and conditions of contract may also be seen there, and at Port Patrick Coastguard Station and the Office of the Director of Works Department, Admiralty, at which latter place tenders are to be deposited before noon on June 1.

June 1. Leeds. — Erection of a woollen mill adjoining Dewsbury Road, Beeston, Leeds, for W. Douglas. Persons desirous of tendering for the various works required should send in their names to T. A. Buttery & S. B. Birds, 1, Basinghall Square, Leeds. Plans and specifications may be seen and quantities obtained on and after May 25. Sealed and endorsed tenders to be sent to T. A. Buttery and S. B. Birds, 1, Basinghall Square, Leeds, before 4 p.m. on June 1.

June 2. Arnside. — Erection of a residence at Arnside, for W. F. Bolton. Plans and specifications may be seen and particulars obtained at the office of G. L. Hoggarth, architect, Kendal and Arnside, to whom tenders are to be sent by June 2. Preference will be given to the contractors who can commence and complete the work in the shortest time.

June 2. Priddy. — Alterations and additions to the Council school, Priddy, during the summer holidays. Drawings and specifications are at the offices of Price & Jane, Weston-super-Mare. Sealed tenders must reach the County Education Office, Weston-super-Mare, before noon on June 2.

June 2. Leigh. — School. The Corporation of Leigh invite builders desirous of tendering for the erection of a new school in Windermere Road to send in their names to the architects, J. C. Prestwich & Son, Bradshaw Gate Chambers, Leigh. The drawings, general conditions and specification may be inspected, and the bill of quantities with the form of tender annexed, obtained at the offices of the Architects on deposit of £1. Tenders on the form provided, addressed to the Chairman, School Buildings Committee, Town Hall, Leigh, and endorsed "Tender for Council School," must be sent to Stanley Wilson, town clerk, Town Hall, Leigh, before noon on June 2.

June 2. Pickering. — Erection of a villa residence at Pickering. Plans and specifications may be seen on application to the Rev. J. W. Brown, 28, Burgate, Pickering, or at the office of Samuel Dyer, architect, Bridlington, where sealed and endorsed tenders are to be delivered on or before June 2.

June 2. Antrim. — Erection of a villa on the Holywell Estate, near Antrim, for the Committee of Management of the County Asylum. The plans and specification may be inspected at the office of the Clerk of the Institution, and at the office of S. C. Hunter, 2, Wellington

Place, Belfast, from which latter copy of the bill of quantities may be obtained on payment of a deposit of £1 1s. Sealed tenders, to be endorsed "Tender for Villa," and addressed to the Chairman of Asylum Committee, Holywell, Antrim, to be sent in or before noon on June 2. Copies of the plans and specification may be obtained on application to A. Basil Wilson, M.I.C.E., Maryville, Malone, Belfast, on payment of the sum of £1, which will not be returned.

June 4. Kinloss and Findhorn. — Mason, carpenter, slater, plumber, plasterer and painter works of alterations and additions at the schools of Kinloss and Findhorn. Plans and specifications may be seen with Peter Fulton, architect and surveyor, North of Scotland Bank Buildings, Forbes, who will receive tenders up to 10 a.m. on June 4.

June 4. Ludlow. — Extension of the Infirmary at the Union Workhouse, and for the execution of works of drainage at the same workhouse. For plans and specifications apply to B. Weale, architect, East Hamlet, Ludlow. Separate tenders for each of the works must be sent in to Arthur W. Weyman, clerk to the Guardians, Ludlow, on or before June 4.

June 4. Durham. — Improvements to Middleton Moor School. Plans, specification and conditions of contract may be seen and forms of tender obtained at the School or the Architect's Office. Sealed endorsed tenders to be delivered to W. Rushworth, F.R.I.B.A., architect, County Education Offices, Shire Hall, Durham, on or before June 4.

June 4. Taunton. — For the following works in accordance with the specifications, &c., prepared by the borough surveyor: — Erection and putting up of a mortuary and post-mortem room at the Coal Orchard Yard; paving (with bricks), curbing and channelling of one side of Leslie Street, Rowbarton; painting, &c. of the outside woodwork and ironwork at Lambrook Farm. Plans, specifications and other particulars can be obtained at the Borough Surveyor's Office during the usual office hours, on depositing £1 1s. Tenders, on the prescribed form only, must be addressed, in sealed envelopes, to the Town Clerk on or before June 4, and endorsed on the outside "Tender for —."

June 4. Croydon. — Erection of small first-floor additions to the workshops at the workhouse, Queen's Road, Croydon. The plans, specification and conditions of contract may be seen, and bills of quantities with form of tender obtained at the office of Henry Berney, architect, 104, George Street, Croydon, surveyor to the Guardians, upon depositing the sum of £3 3s. Tenders, sealed and marked "Tender for Additions to Workshops," to be addressed to Harry List, clerk to the Guardians, Union Offices, Mayday Road, Thornton Heath, Surrey, and delivered by June 4.

June 4. Stratford-upon-Avon. — Erection of a cloakroom, &c., at the rear of the Town Hall. Plans and specification of the work may be seen upon application at the Borough Surveyor's office. Tenders, sealed and endorsed "New Cloak Room," to be delivered to Roden Dixon, borough surveyor, Municipal Offices, Stratford-upon-Avon, by June 4.

June 5. Darwen. — Iron and steelwork in the construction of the new free library. Quantities and particulars can be obtained from the architects, Haywood & Harrison, Post-office Chambers, Accrington, at whose office plans of the proposed work can be seen. Sealed tenders, endorsed "New Library Iron and Steelwork," must be forwarded to William P. Halliwell, town clerk, Town Clerk's Office, Darwen, on or before June 5.

June 6. Wallsend. — Erection of a building in connection with the Cookery Centre of the Education Department of the borough of Wallsend, and the Richardson Dees School. Amended plans and specifications may be seen on application to the Borough Surveyor, George Hollings, Corporation Offices, Hugh Street, Wallsend. Tenders to be delivered to W. V. Mulcaster, town clerk, Wallsend, marked "Tenders for Cookery Centre," on or before June 6.

June 6. Naburn. — Erection of two cottages and office, at Naburn Locks. Specification and bill of quantities may be obtained from A. Creer, architect, Guildhall,

York, on deposit of £1 is., to whom tenders, endorsed "Cottages, Naburn," must be delivered not later than June 6.

June 6. Carlisle.—*Extension of buildings at the Central Electric Lighting Station, situate in James Street.* Persons desirous of tendering for the above works may inspect the drawings, specification, stipulations and conditions of contract, and obtain a copy of the bill of quantities and form of tender, at the office of Henry C. Marks, M.I.C.E., city engineer and surveyor, 36, Fisher Street, Carlisle, on deposit of 10s. 6d. Sealed tenders, endorsed "Tender for Electric Lighting Station," to be delivered at the City Engineer's Office, not later than 10 a.m. on June 6.

June 7. Stockport.—*Erection of the first portion of an observation block at Dialstone Lane Hospital.* The plans, drawings and general conditions may be inspected at the office of the architect, G. H. Brady, Borough Chambers, St. Petersgate, Stockport, and specifications and quantities will be supplied by him on payment of a deposit of £1 is. Sealed tenders, endorsed "Hospital Building Contract," addressed to the Chairman of the Health Committee, must be delivered to Robert Hyde, town clerk, Town Clerk's Office, Stockport, not later than noon on June 7. Fair wages clause.

June 7. Huddersfield.—*Supplying and fixing of skylights at the Artizans' Dwellings, for the Corporation.* Plans, specifications and general conditions may be seen, and bills of quantities and forms of tender obtained on application at the offices of the Borough Engineer, 1, Peel Street. Sealed tenders, endorsed "Tender for Skylights," signed in the handwriting of the tenderer or his agent, and addressed "Town Clerk, Town Hall, Huddersfield," must reach him not later than 10 a.m. on June 7.

June 8. Salcombe.—*Erecting two houses and three shops at Salcombe.* Drawings and specification can be seen on application to the "Times" Office, Salcombe, and tenders to be delivered to J. Wills, Bar Lodge, Salcombe, before noon on June 8.

June 8. Carlisle.—*Erection of a caretaker's cottage at the Meeting of the Old and New Waters, Gelsdale, for the Corporation.* Persons desirous of tendering for the above works may inspect the drawings, specification, stipulations and conditions of contract, and obtain a copy of the bill of quantities and form of tender at the office of Henry C. Marks, M.I.C.E., city engineer and surveyor, 36, Fisher Street, Carlisle, on deposit of 10s. 6d. Sealed tenders, endorsed "Tender for Cottage," to be delivered at the City Engineer's Office, not later than 10 a.m. on June 8.

June 9. St. Austell.—*Erection of a new gallery and certain other alterations at the Bible Christian Chapel, Bugle.* Plans and specifications may be seen and full particulars obtained at the office of the architect, F. C. Jury, No. 1, Alma Villas, Tregonissey Road, St. Austell. Tenders, sealed and endorsed "Bugle Chapel Tenders," must be sent to the Rev. W. H. Webber, Fernleigh, Bodmin, on or before June 9.

June 9. Leith.—*Terazzo work in connection with the erection of the new porch at Leith, for the Parish Council.* Contractors desirous to tender for the work will, on application to James Miles, clerk, 45, Charlotte Street, Leith, be supplied with specification and schedule of quantities, on payment of a deposit of £1 is., not later than June 2. No offer will be considered unless accompanied by the priced schedule, which must be delivered by June 9.

June 9. Morriston.—*"Libanus" new schoolroom.* Persons desirous of tendering for the above can inspect plans and specifications and obtain all particulars at the offices of Charles S. Thomas, architect and surveyor, Wind Street, Swansea. Tenders to be sent to George Rowe, Llanllienwen, Morriston, on or before June 9, endorsed "Tender for Libanus Schoolroom."

June 11. Swindon.—*Erection of laundry buildings and disinfecting house, for the Guardians.* Plans and specifications can be seen and particulars obtained on application at the office of the architect, R. J. Beswick, M.S.A., 10, Victoria Road, Swindon. Sealed and endorsed tenders to be delivered to John P. Kirby, clerk to the Guardians, Union Offices, Victoria Road, Swindon, on or before 5 p.m. on June 11.

June 11. Burley.—*Additions to the council school.* Persons desirous of tendering may see plans, specification and conditions of contract, and obtain bills of quantities, at the office of W. J. Taylor, county surveyor, The Castle, Winchester, between 9 a.m. and 5 p.m. (Saturdays 9 a.m. to 1 p.m.) on payment of £2 2s. Deposits must be made by cheque payable to Hants County Council and crossed Bank of England, or particulars will not be sent. Tenders, endorsed "Proposed Additions, Burley Council School," are to be delivered to H. Barber, clerk of the County Council, The Castle, Winchester, on or before 10 a.m. on June 11.

June 12. Bristol.—*Additions and alterations to the Club-house, Failand, for the Bristol and Clifton Golf Club.* Persons desirous of tendering can see the plans and specifications, and obtain bills of quantities, at the offices of Bernard & Son, 41, St. Stephen's Chambers, Baldwin Street, Bristol, on and after May 31. Tenders to be delivered by June 12.

June 12. Rugby.—*Proposed new wing to the hospital of St. Cross.* Bills of quantities and forms of tender may be obtained at the offices of the architect, J. D. Hoper, Albert Street, Rugby, on payment of £1 is. Fair wages clause. Sealed tenders, on forms supplied, must be delivered before noon on June 12, addressed to the Chairman of Children's Wards' Committee, and endorsed "Tender for New Wing."

June 13. Portland.—*Erection of the Wesleyan Methodist Church, Easton Square.* Bills of quantities may be obtained from the architects, La Trobe & Weston, F.R.I.B.A., 44, Corn Street, Bristol, or from R. Pearce, 3, Easton Square, Portland, on payment of a deposit of a £2 2s. Tenders to be sent in before June 13.

June 13. London, S.W.—*Erection of two additional ward blocks, recreation hall, and staff quarters at Tooting Bee Asylum, Tooting, S.W., for the Metropolitan*

Asylums Board, in accordance with drawings and specification prepared by W. T. Hatch, M.I.C.E., M.I.M.E., engineer-in-chief. Drawings, specification, bills of quantities, conditions of contract and form of tender may be inspected at the Office of the Board, Embankment, E.C., and bills of quantities and form of tender obtained upon payment of a deposit of £5. Tenders, addressed as noted on the form, must be delivered at the Office of the Board not later than 10 a.m. on June 13.

June 14. Penrith.—*Heightening the Presbyterian Church of England, Penrith, lengthening nave and erecting chancel, organ-chamber, minister's and deacons' vestries, class-rooms, &c.* Plans can be inspected and all information obtained at the office of Stephen Shaw, F.R.I.B.A., architect, Kendal, where quantities and specifications can be had till June 14, upon which day endorsed tenders are to be sent in. A duplicate set of plans can be seen in the Church Hall from 10 till 4.

June 15. Grimsby.—*Erection of proposed new hall, Garibaldi Street, for the Ancient Order of Foresters.* Plans, specifications, form of tender, and all particulars may be obtained at the office of the architect, Herbert Heap, A.M.I.C.E., architect and surveyor, Osborne Chambers, between 9 a.m. and 6 p.m. Sealed tenders, which must be endorsed "Tender for Proposed New Hall," and addressed to T. Steel, secty., must be delivered at No. 164, Oxford Street, Grimsby, not later than June 15.

June 15. London, N.—*Erection of a bandstand, composed of brick, wood and tiles, at Finsbury Park, N., for the London County Council.* Persons desirous to submit tenders may inspect the drawings and obtain the specifications, bills of quantities, form of tender and other particulars at the Architect's Department, 15, Pall Mall East, S.W., upon payment to the cashier of the Council, at the County Hall, Spring Gardens, S.W., of the sum of 10s. Tenders must be upon the official forms, and the printed instructions contained therein must be strictly complied with. Fair wages clause. Each tender is to be delivered at the County Hall, in a sealed cover, addressed to the Clerk of the London County Council, Spring Gardens, S.W., and marked "Tender for Bandstand at Finsbury Park." No tender will be received after 10 a.m. on June 15.

June 16. Knock.—*Erection of one detached and two semi-detached villas at Kensington Road, Knock.* Plans and specifications may be had at the office of Thomas Houston, architect and civil engineer, Kingscourt, Wellington Place, Belfast, with whom sealed and endorsed tenders are to be lodged by June 16.

June 16. Manchester.—*Extension of the existing laboratory at the Davey Hulme Sewage Works, near Urmston.* Drawings may be inspected and bills of quantities and tender forms may be obtained on application to the Secretary of the Rivers Department, Town Hall, Manchester. Tenders must be enclosed in the official envelope provided expressly for the purpose (otherwise the tender will not be considered), and delivered at the above office not later than 10 a.m. on June 16.

June 18. Talgarth.—*Repair of Llandefalle Church, Talgarth.* Plans and specifications can be seen at Llandefalle Rectory on and after June 4. Tenders to be sent to Ernest V. Collier, M.S.A., architect, 4, Quay Street, Carmarthen, not later than June 18.

June 20. Cheltenham.—*Erection of new school buildings, to accommodate 1,100 children for the Gloucester Road district of Cheltenham, in accordance with plans, specifications and conditions of contract to be seen at the offices of Chatters & Smithson, architects, 17, Regent Street, Cheltenham.* Early application is requested for bills of quantities, which will be supplied by the architects upon receipt of a deposit of £2 2s. Tenders, sealed and endorsed, must be delivered to William Preston, secty., Education Offices, Rodney Road, Cheltenham, by noon on June 20.

June 21. Fishguard.—*Building a new chapel.* Plans and specification may be seen on application to the architects, George Morgan & Sons, F.R.I.B.A., A.R.I.B.A., 24, King Street, Carmarthen, or to D. B. Phillips, surveyor, High Street, Fishguard, to whom sealed tenders are to be sent on or before June 21.

June 23. Brentwood.—*Remodelling one of the blocks of buildings at the Essex County Asylum so as to form attendants' quarters.* Drawings and specifications and form of contract may be inspected at the office of the county architect, Frank Whitmore, Duke Street, Chelmsford, between 10 a.m. and 4 p.m. on any working day except Saturdays. Persons desirous of tendering must send in their names and addresses to the County Architect not later than noon on June 4. Sealed tenders, on the form supplied, endorsed "Tender for Female Attendants' Block," should be delivered to W. P. Gepp, clerk to the Committee of Visitors, Chelmsford, not later than 10 a.m. on June 23.

No date. Basford.—*Erection of new stores in Egypt Road, for the Cinderhill Co-operative Society, Ltd.* Bill of quantities may be obtained from the architect, W. V. Betts, 630, Radford Road, Old Basford, on payment of £2 2s. Fair wages clause.

No date. Bispham.—*Stabling, fencing, &c., to residence, Bispham.* For quantities apply F. T. Waddington, architect, 10, Birley Street, Blackpool.

No date. Brandon.—*Erection of a dwelling-house and business premises in High Street, Brandon.* For particulars, plans and specification apply Thomas A. Green, Brandon Printing Works.

No date. Maidstone.—*Construction of the Empire Theatre.* Address, in the first instance, for plans, specifications, &c., The United States Commercial Agency, 199, Piccadilly, W.

No date. Haslingden.—*Erection of a new weaving shed, for the Grane Manufacturing Co., Ltd.* Firms desirous of tendering for any portion of this work must communicate with P. Pickup, mill architect, Mercantile Chambers, St. James Street, Burnley, from whom full particulars can be obtained.

No date. Beccles.—*Erection of a new hotel, with stabling, coach-house and cartshed, at Ingate Street, Beccles, for the Colchester Brewing Co.* Contractors desirous to tender are requested to send at once their names and addresses to Arthur Fells, F.S.I., architect, Beccles. Bills of quantities and form of tender will then be forwarded in due course.

No date. Omagh.—*Building a new clubhouse in Omagh, according to the plans prepared by Godfrey W. Ferguson, architect, of Avenue Chambers, Belfast, at whose office the plans can be seen.* Copies of quantities may be had from S. C. Hunter, quantity surveyor, Scottish Provident Buildings, Belfast. Further particulars can be obtained from Colonel H. Irvine, Estate Office, Omagh.

No date. Foyers.—*Mason, carpenter, plumber, slater, plasterer and painter and glazier works, &c., of Nursing Home, proposed to be erected at Foyers, for the British Aluminium Co., Ltd.* Contractors desirous of tendering are requested to lodge their names with Cameron & Burnett, architects and ordained surveyors, Academy Buildings, Inverness, from whom schedules of quantities and all other information are to be obtained.

ENGINEERING.

May 31. Halifax.—*Erection of No. 2 Cornish boilers and fittings thereto; also sundry works in connection with same, at the Workhouse, Gibbet Lane, Halifax.* Plans may be seen and specifications obtained at the office of W. Clement Williams, architect, 29, Southgate, Halifax, until May 31, on which last-named date sealed tenders are to be delivered at the offices of the clerk to the Guardians, Arthur T. Longbotham, solicitor, Carlton Street, Halifax, not later than 10 a.m., endorsed "Tender for Boilers, Halifax Workhouse."

June 1. Southport.—*Making, delivering, and erecting a wood and iron pumping engine-shed required for the proposed Bickerstaffe pumping-station, situate at or near Royal Oak, in the parish of Bickerstaffe, about 2½ miles by road from the Town Green and Aughton Station of the Lancashire and Yorkshire Railway for the Southport, Birkdale and West Lancashire Water Board.* A copy of the specification and form of tender may be obtained on payment of £1 is., at the office of the Board or at the offices of H. Rofe & Son, civil engineers, 8, Victoria Street, Westminster, and Oxford Chambers, Victoria Square, Leeds. Photo prints of the plan can also be obtained by application to 8, Victoria Street, Westminster, on payment of 1s. 6d. Tenders, endorsed "Tender for Pumping Engine-shed," to be sent in to Alleyne Browne, clerk to the Board, 11, St. George's Place, Lord Street, Southport, on or before June 1.

June 1. Colwyn.—*Supply, delivery and erection of the following for the U.D.C.:—Section 1, water-tube boiler, &c.; section 2, steam dynamo; section 3, condensing plant.* Copies of general conditions, specifications and forms of tender, can be obtained from the electrical engineer, A. R. Tudman, on payment of £1 is. per section. Sealed tenders to be sent to the clerk, James Amphlett, Council Offices, Colwyn Bay, not later than noon on June 1.

June 4. Pontypridd.—*Supply, delivery and putting to work of about 2,640 yds. of 3 triple concentric feeder and pilot cables, paper insulation.* Specification, general conditions and form of tender may be obtained on application to J. E. Teasdale, A.M.I.E.E., electrical and tramways engineer, upon payment of a deposit of £2 2s. Tenders on the prescribed form, sealed and endorsed "Tender for Cables," must be received by J. Colenso Jones, clerk to the Council, District Council Offices, Pontypridd, on or before June 4.

June 5. Portsmouth.—*Supply of sixteen double decked tramway electric motor cars.* The specification, with general conditions and form of tender, can be obtained on application to the Town Clerk, Town Hall, Portsmouth, but a deposit of £5 5s. must accompany the application. Drawings may be seen at the office of V. G. Lironi, M.I.M.E., A.M.I.E.E., tramways engineer, Vivash Road, Fratton, Portsmouth. Fair wages clause. Tenders must be delivered to the Town Clerk, Town Hall, Portsmouth, not later than 10 a.m. on June 5.

June 7. Handsworth.—*Construction of a storage tank in Hennebique's patent ferro-concrete at the Public Baths, Grove Lane, Handsworth.* Plan, specification and conditions of contract and form of tender may be obtained at the offices of the architect, J. P. Osborne, F.R.I.B.A., of 95, Colmore Row, Birmingham, on depositing with him the sum of £2 2s. Fair wages clause. Tenders, on the prescribed form, enclosed in sealed envelopes, endorsed "Tender for Storage Tank," must be delivered to H. Ward, clerk, the Council House, Handsworth, near Birmingham, not later than noon on June 7.

June 8. Melrose.—*Repair of two bridges on the main road, near Buckholm, the work consisting of stripping arches and haunches, covering them with coat of concrete 2 ins. thick, building tie walls, &c., for the Roxburghshire County Council.* Plans and specifications may be seen and schedules obtained at the office of C. Monteath, C.E., Newton St. Boswells. Sealed tenders, marked "Tender for Buckholm Bridges Repairs," to be lodged with A. Murison Small, W.S., district clerk, Melrose, not later June 8.

June 9. Paignton.—*Supply, delivery and laying of a 7 in. cast-iron water-main, together with the requisite meter, sluice valves, air valves, washouts and other fittings, meter-house and store, and other works in connection with Paignton water supply in the parishes of Marldon and Paignton, from Churchcombe Cross to the Paignton and Churston Ferrers parish boundary.* Drawings may be seen and copies of specification, bills of quantities, and forms of tender obtained at the office of the engineer, Frederick W. Vanstone, Palace Chambers, Paignton, on payment of £5. Sealed tenders, upon the form provided, endorsed "Paignton Waterworks," are to be addressed to James R. Mill, clerk to the Council, Town Hall, Paignton, on or before June 9.

(Continued on p. 296.)

Notes and News.

The Hearts of Oak Benefit Society's new offices in the Euston Road were opened by the King on Saturday last. The building, which has cost £100,000, was designed by Messrs. Essex, Nicol & Goodman, the contractor being Mr. C. Gray Hill, of Coventry.

Mr. Max Clarke, F.R.I.B.A., of 4, Queen Square, Bloomsbury, W.C., has taken into partnership Mr. Matt Garbutt, F.R.I.B.A., A.M.I.C.E., at present the architect to the Metropolitan Railway Co. The name of the firm will be Max Clarke & Garbutt, to whom all professional communications should be addressed after June 1st.

Subsidence at Bilston.—The opening-up of the streets at Bilston, Staffs, in connection with a sewage-disposal system, has led to the discovery that only a short distance below the roadways the ground is honey-combed with mines dug long ago. The excavations pass the town hall, and subsidences have occurred causing cracks in the building, which has had to be propped up with timber while some scheme is devised whereby to prevent a disaster.

A new High-Level Bridge at Newcastle-on-Tyne is being erected for the North-Eastern Railway Co. by the Cleveland Bridge & Engineering Co., of Darlington. With its approaches the bridge will have cost about £500,000. It is built of steel, of lattice girder type, and carries four sets of lines. Caissons were sunk to a depth about 70ft. below high-water spring-tides, and on these the piers were built. There are five latticed steel girders in each span, each weighing 300 tons. They are 27ft. in depth, with a width of 4ft. 6ins. The width of the bridge is 48ft. 6ins. from parapet to parapet.

A new Edinburgh Theatre.—The King's Theatre, Edinburgh, is approaching completion. The building, which is Free Classic in character, was designed by Messrs. Swanston & Davidson, of Kirkcaldy and Coatbridge. The material used is from the Closeburn quarries, Dumfriesshire, and the builders are Messrs. W. S. Cruikshank & Sons, Edinburgh. The length of the building is 200ft., and the general width 92ft., the auditorium being 72ft. from side to side. The building has been designed to accommodate 3,000 persons. The house is divided into the usual sections, but the boxes provide an entirely new feature. They are fitted with swing partitions, capable of being divided up into one or three, and providing in this way eighteen in all.

New Stands at Newmarket have been erected of brick and iron, with a thatched roof 130ft. long and 39ft. wide. They will accommodate 1,500 people on seventeen flights of steps, the highest of which is 15ft. 3ins. above ground-level. Underneath the stand are a refreshment bar 44ft. by 23ft., press-room, telegraph-room and receiving office, and ladies' cloak-room. In the rear of the building are a public luncheon-room 44ft. by 21ft., kitchens, stores, doctors' room, cloakroom, lavatories, &c. The stand in "silver ring" will accommodate 1,000 people. It is 82ft. 6ins. long and 37ft. 6ins. wide. Under the stand is a refreshment bar 80ft. by 22ft. 6ins. The stands are built at an angle of 19½ degs. to the course. They have been jointly designed by Mr. C. W. Marriott and Messrs. Barber & Sons, surveyors, of London, the builder being Mr. H. Holland, of Newmarket. The ironwork was done by Messrs. Homan & Rogers; the concrete steps by Messrs. Royal, of Cambridge; and the thatching by Mr. W. Oldfield, of Whittlesea.

AN OPEN-AIR SWIMMING BATH.

AN open-air swimming-bath has been provided at Chelmsford by the municipality. It is in the Greyhound Mead, and is said to be the largest of its kind in the kingdom. The bath is 150ft. by 100ft., with a water area of 15,000 sq. ft. It has a depth of water varying from 3ft. to 6ft. and holds 400,000 gallons. It is constructed partly above and partly below ground, and is surrounded by two paved footpaths in the form of terraces, which were formed with the excavation material from the centre of the bath. The bottom of the bath is lined with 1,490 sq. yds. of concrete flags, grouted together, and the sides formed with cement-concrete. A sand filter 50ft. by 20ft. is provided at the end through which the water passes before entering the bath. On the top terrace, which extends the full length of the site, 2ft. 6ins. above the water level, thirty-six dressing-boxes are provided. There is also an open dressing shed, about 80ft. long, for free bathers, with caretaker's shed and cycle store adjoining. The terrace is planted with shrubs and flowers. The site is surrounded by a corrugated iron fence 7ft. 6ins. high. An island built of timber is fixed in the centre, and arranged in the form of step platforms for diving purposes. In addition there are two spring diving boards. The water is supplied from the River Chelmer, and is conveyed from the dam at Springfield Mill by a 12in. pipe main to the sand filter. After being filtered it runs direct into the bath at the deep end, but it can, if required, be diverted before reaching the filter, and made to enter the bath at the shallow end. The work has been carried out under the entire supervision of the borough engineer and surveyor, Mr. Cuthbert Brown. The total cost has been under £700.

DRAWN BY: WALTER MILLARD.

TESTING VARNISHES.**Old and New Methods.**

THE subject of testing oil varnishes has hitherto been dealt with to only a very limited extent; therefore any information which will help to determine their intrinsic value, either as decorative agents or as protective materials, must necessarily be of great value to the user or purchaser of large quantities of varnish.

There are many persons who regard chemical analysis with feelings of greater veneration than the occasion always warrants, but, says Mr. J. Cruickshank Smith, B.Sc., F.C.S., M.S.C.I., writing in the "Decorator," there is an objection to chemical tests as the sole means of determining the value of oil varnishes which may be pointed out. It is that varnish manufacturing practice is not nowadays the simple guileless process that it was in the "good old days." Unhappily science holds out helping hands both to the just and to the unjust, and it sometimes happens that the latter class is less disinclined to refuse the proffered aid than the former. Processes are in existence for hardening resin and for enabling compounds of lime and other metallic bases with resin to be incorporated in oil varnishes. Such methods may be bad or they may not, but they increase enormously the difficulty of the consultant who is compelled with only chemical data at his disposal to form an opinion on the suitability or durability of a particular varnish for a particular piece of work.

Therefore it is that the tendency appears to work along the lines of physical tests. These tests may be roughly divided into two groups. The first group includes those tests of a strictly scientific nature, such as the determination of specific gravity, viscosity, optical activity, solubility, constants and the like.

The second group of physical tests includes those which are based on the theory that the capacity of varnish films to resist the influences they may be expected to undergo in actual use over a considerable period of time can be estimated with fair accuracy by exposing the films to severe but rigidly controlled conditions for a short period of time and then examining their physical condition.

Natural Drying Test.

This test is undertaken in order to determine the rate of drying of the varnish under normal conditions, and the condition of the varnish film after drying. Drying under normal conditions with free access of air is by no means easy to ensure, as a very little consideration will show.

Numerous experiments have proved conclusively that the question of humidity of the atmosphere is at the root of many of the abnormalities met with in the drying of varnish. The presence of moisture in the air at once interferes both with the evaporation of the turpentine and the oxidation of the oil. All free-drying tests should therefore be conducted in a dry airy chamber which can be maintained at a temperature of 55 degs. to 60 degs. Fahr.

The varnish is poured on a clean dry glass slip 2 ins. by 6 ins. in sufficient quantity to cover three-quarters of the slip. The various slips are then stood vertically upright for five minutes in order that excess of varnish may drain off. Any drops that adhere to the edges of the glass are carefully removed with blotting paper, and the slips are then placed on racks inclined at an angle of 10 degs. The temperature is maintained at as near 60 degs. Fahr. as possible, not more than 2 degs. variation either way being permissible, for twenty-four hours. No ordinary oak, copal or carriage varnish of good quality will be sensibly tacky to the touch after twelve to fourteen hours. Twelve hours may be regarded as a satisfactory limit for

house-painters' varnishes and eighteen hours for coach-painters' and extra pale varnishes. After drying, the film should be transparent, free from specks, lustrous, and hard yet elastic.

Forced Drying Test.

The question has been discussed whether in the case of oil varnishes the results of a short exposure under extreme conditions can be utilized in order to give information as to the probable results of prolonged exposure under ordinary conditions. The results of many experiments appear to indicate that in a general way they can.

The test samples are poured on glass slips, as in the natural drying test, and the slips are drained vertically for five minutes. They are then heated for twenty-four hours in a hot-air chamber through which circulates a steady stream of pure dry air maintained at 100 degs. C. In applying the test it is well to always employ two or three control samples. Thus one ought to conduct four similar experiments with the same varnish. If three concordant results are obtained they may be taken as correct, but if less than 75 per cent. of the samples emerge successfully from the ordeal, either they must be condemned or the test must be repeated. The result that one looks for in a varnish film after exposure to this test is a hard dry transparent tough film, free from cracks, and coming off in ribbon-like scales when scraped with a steel point. Powdering under the tool is a fault, so is too soft a result. Fissures and cracks should be carefully looked for not only with the naked eye but under a hand lens or low-power microscope.

Air-drying Test with Pigment.

When the surface of a varnish that is exposed to the air is increased relatively to the total bulk of varnish there is a considerable increase in the rate of drying. This fact may be made use of in testing varnishes. Equal parts by weight of varnish and oxide of zinc are rapidly incorporated by means of a palette knife on a glass slab, and the mixture is painted on a glass slip and exposed to the air under fair drying conditions. Exterior and "elastic" varnishes ought not under these conditions to take more than nine hours to dry. Interior and "hard drying" varnishes may take rather less, but not less than six hours.

The foregoing test may also be made use of to determine the intrinsic colouring power of the varnish. The exterior characteristics of varnish which should be carefully examined in comparing different samples are brightness and colour. Brightness practically means freedom from suspended matter, and special attention should be directed to this point, as it has been found that the durability of varnish films is greatly interfered with if suspended matter is present even in small traces.

Colour should be compared against some definite standard. Varnishes may be conveniently divided into four groups as regards colour, viz., extra pale, pale, medium and dark. The palest white copals and French oil varnishes would fall under the first heading. Pale varnishes would include the pale copals, pale carriage varnishes, maple and pale oil paper varnishes. "Medium" would include most of the standard copal oaks, darker carriage varnishes, &c. "Dark" would be reserved for a still darker group.

Colour Comparison.

In comparing the colour of varnishes use may again be made of dried films on glass slips, the actual determination of the colour in comparison with a standard taking place at least forty-eight hours after the varnish ceases to be tacky. It will be found that many varnishes which are pale in themselves, and when first spread out in a thin film, darken materially in drying.

There is still a whole series of combined chemical and physical tests which cannot be neglected if a really reliable opinion is to be

formed as to the composition of the varnish. Thus the presence of rosin, unsaponifiable matter, metallic compounds and other foreign substances have sometimes to be looked for, particularly if the varnish is bought to specification.

Correspondence.**The Architectural Draughtsman.**

To the Editor of THE BUILDERS' JOURNAL.

SIR,—I think the Chard draughtsman might see something to be admired in the action of the pupil who, after having placed trees in the wrong field, seriously drew an arrow from the middle of them into the right field, as set forth in your columns. The plan is a means to an end, and no doubt the method here adopted served the desired end! Why do more? The position of draughtsmen is now very precarious, and the dearth of employment is due to the fact that plans are rather overdrawn. The time spent upon a sheet of paper is too great, with the result that many architects—younger men more especially—are mere paper architects or paper draughtsmen. A man who spends so much energy on paper is useless as a practical building man.—Yours truly, PRACTICE.

Law Cases.

Builders and the Water Board.—On May 21st at the North London Police Court Mr. Fordham delivered a considered judgment in the case of *Paine v. The Metropolitan Water Board*. The summons was taken out under section 43 of the Water Works Clauses Act, 1847, for neglecting to supply water by measure to the complainant at his request. The facts, as stated in the "Times," were these:—The complainant, a builder, is the owner and occupier of a piece of land adjoining Moresby Road, Upper Clapton, where a water main had been laid by the East London Water Co. The land until recently was appurtenant to a house, and was used as a garden, upon part of which the complainant had built about ten houses, but further building operations were in progress. The complainant, being desirous of having a supply of water by measure for use in his building operations, requested the defendants, as successors to the water company, to supply him with water by measure, and he tendered with that request the sum of £2 2s. in payment for 25,000 gallons of water at the rate of 9d. per 1,000 gallons—the maximum price—and for what he considered would cover the cost of laying the supply from the street in which the main was laid to his land. The defendants neglected to supply water by measure to the complainant, who asserted that they were in consequence liable to penalties for such neglect. The defence put forward by counsel for the Board was that they were not bound to supply water by measure because the complainant was not the owner or occupier of any "premises" situate in or adjoining any street in which any main or service pipe of the defendants was laid, and so could not claim a supply of water under section 79 of the East London Water Works Act, 1853, and it was argued that the spot at which the supply was to be used could not be described as "premises" within the meaning of the section, and therefore that the complainant was not entitled to a supply of water by measure, but must take water for his building operations by agreement with the defendants under section 78 of the Act. The magistrate held that the complainant was entitled to the supply he claimed under section 79, since he was the owner and occupier of "premises" in the commonest use of the word. He fined the Water Board 40s., and ordered them to pay 10 guineas costs.

(Continued on p. 293.)

June 9. Hull.—Construction of a covered concrete service reservoir at Keldgate, to hold about ten million gallons. Drawings may be seen and copy of specification and form of tender may be obtained at the City Water and Gas Engineer's Office on payment of £2. Cheques and postal orders to be made payable to T. G. Milner, city treasurer, Hull. Tenders, endorsed "Tender for Covered Service Reservoir," are to be addressed to the Chairman of the Water and Gas Committee, and delivered at the Town Clerk's Office not later than June 9.

June 11. Portsmouth.—Supply of tramway feeder cables. The specification, with general conditions and form of tender, can be obtained on application to the Town Clerk, Town Hall, Portsmouth, but a deposit of £5 5s. must accompany the application. Drawings may be seen at the office of V. G. Lironi, M.I.M.E., A.M.I.E.E., tramways engineer, Vivash Road, Fratton, Portsmouth. Fair wages clause. Tenders must be delivered to the Town Clerk, Town Hall, Portsmouth, not later than 10 a.m. on June 5.

June 11. London, N.—Supply and erection of one cold water-softening plant, capacity about 2,000 gallons per hour continuous working. Plans may be seen, and conditions, specification and form of tender obtained at the office of the electrical engineer to the Council, E. Calvert, Electricity Works, Squires Lane, Finchley, N. A Winchester quart sample of the water will be sent to firms desiring to tender on receipt of 5s. (not returnable) to cover expenses of sending same. Sealed tenders, marked on the outside "Electricity Works, Section XXVII," to reach E. H. Lister, clerk to the Council, Council Offices, Finchley, before 5 p.m. on June 11.

June 12. Nuneaton.—Supply, delivery and erection of one 200-hp. steam dynamo, for the U.D.C. Copies of the general conditions, specification and form of tender may be obtained on payment of £2 2s. Additional copies of the specification may be had on payment of 10s. per copy, which amount will not be returned. Sealed tenders, endorsed "Tender for Steam Dynamo," and addressed to the Chairman of the Electric Light Committee, Electricity Works, Nuneaton, will be received up to noon on June 12.

June 12. Kempton.—Water supply. A.—The provision, delivery, laying, and jointing in the rural district of Bedford of about 550 tons of cast-iron pipes (principally 7 in. and 8 in.) and for the construction of certain ancillary works; and B.—The supply, delivery, laying and jointing of about 5 miles 325 yds. of 7 in., 6 in., 4 in. and 3 in. cast-iron socket pipes, with appendages, including all necessary sluice and air valves, hydrants, and other works, for the water-supply of the urban district of Kempston. Plans, specifications and conditions may be seen as regards contract A at the offices of the engineer, George F. Deacon, 16, Great George Street, Westminster, S.W., and as regards contract B at the offices of the engineers, Beesley, Son & Nichols, 11, Victoria Street, Westminster, from whom respectively specifications, bills of quantities and forms of tender can be obtained on payment of £5 for each contract. Sealed tenders, endorsed "Tender for Waterworks Contract A" (or B), to be addressed to William Payne, clerk of the Council, and sent to the U.D.C. Offices, Bedford Road, New Town, Kempston, at or before noon on June 12.

June 14. Battle.—Supply, delivery and laying of about 1,620 yds. of 4 in. water main, and the necessary valves in connection with the same, from the town of Battle to the Battle Union Workhouse. Sealed tenders, endorsed "Tender for Mains, &c.," and addressed to Charles Sheppard, clerk to the U.D.C., Battle, to be sent in not later than noon on June 14. Plan, specification, and general conditions may be inspected at the offices of the Clerk, at Battle.

June 18. Middlezoy.—Supplying and fixing a steel flooring bridge at Greylake's Fosse, Middlezoy, Somerset, in part substitution for the existing bridge and for other alterations of the approach thereto, for the Kings Sedgemoor and Cary Valley District Drainage Board. Specifications and plans may be seen and blue prints of the plans and tender forms may be obtained on application to Walter J. R. Poole, clerk, 9, Dampier Street, Bridgwater, to whom sealed tenders must be sent not later than noon on June 18, marked "Tenders for Greylake's Fosse Bridge."

June 18. Banbridge.—Construction and erection of a steel umbrella roof, 35 ft. by 22 ft., at Banbridge, for the Great Northern Railway Co. (Ireland). Parties wishing to tender may see the drawing and specification at the office of W. H. Mills, engineer-in-chief, Amiens Street, Dublin; or copies of them at the Offices of the District Engineer, Belfast; and can obtain at the said offices lithographed copies of the drawing, specification and form of tender on payment of 10s. (not returnable) per set. Tenders, made out on the forms supplied by the Company, and endorsed "Tender for Umbrella Roof," should be delivered to T. Morrison, secy., Secretary's Office, Amiens Street Terminus, Dublin, not later than 10 a.m. on June 18.

June 30. Leicester.—Construction and erection of a steel bridge over the River Trent, together with the cast-iron cylinders and all dredging, excavating, bricklaying, and masons' work in the abutments and hauling path belonging thereto, in connection with Section No. 2 of the main for bringing the Derwent supply to Leicester. The bridge will be in one span of the bowstring type, supported on four cast-iron cylinders, and having a clear opening of about 220 ft. between the cylinders and a width between the centres of the main arches of 10 ft., and is estimated to weigh about 393 tons, including the cast-iron and steel work in the cylinders and hauling path. The drawings may be inspected at the offices of the engineers, Everard, Son & Pick, 6, Millstone Lane, Leicester, and conditions of contract, specification, quantities and form of tender obtained from them upon payment of £5. Sealed tenders, upon the form supplied, addressed to the Chairman of the Water Committee, Town Hall, Leicester, are to be delivered not later than 10 a.m. on June 30, endorsed "Tender for Trent Bridge—Derwent Main."

June 30. Mansfield.—Sinking a well near Waterfield Farm, in the parish of Clipstone, 5½ miles from Mansfield. The well is to be 150 ft. deep and 12 ft. in

diameter in the new red sandstone, and is to be lined in part with cast-iron tubing. The contractor is to provide temporary pumping plant, capable of raising 70,000 gallons of water per hour 150 ft. high, or 1,680,000 gallons in 24 hours. In addition to the well-sinking, the contract will also include driving certain headings and putting down boreholes. The drawings and specification may be seen at the office of the engineers, G. & F. W. Hodson, Bank Chambers, Loughborough, and copy of the schedule of quantities and form of tender obtained on deposit of a cheque for £3 5s. Sealed tenders, endorsed "Tender for Clipstone Well," to be sent to J. Harrop White, town clerk, Mansfield, not later than June 30.

June 30. Cairo.—Supplies and works in connection with the water supply of Menouf, including engine-houses, pumping machinery, motors, conduits, and steel water tower and reservoir. Specifications, plans, &c., may be seen at the Ministry of the Interior, Cairo. Tenders will be received by the European Secretary of the Ministry of the Interior, Cairo, up to June 30.

Oct. 1. Bangkok (Siam).—Construction of a bridge, 260 metres long, over the Meram River. For particulars apply to the Siamese State Railways, Bangkok. Tenders to be in by Oct. 1.

IRON AND STEEL.

May 31. Carlaway.—Supply and erection of an iron wire fence round the New Cemetery at Dalmore Carlaway, parish of Uig. Specifications may be seen with A. Macdonald, C.E., Municipal Buildings, Stornoway, or with Rev. D. Macleod, The Manse, Carlaway, with whom sealed tenders are to be lodged not later than May 31.

June 6. London, E.C.—Supply and delivery of cast-iron chairs, for the East Indian Railway Co., as per specifications to be seen at the Company's offices. Tenders are to be sent to C. W. Young, secy., Nicholas Lane, E.C., not later than noon on June 6, marked "Tender for Cast-iron Chairs." For each specification a fee of £1 1s. is charged, which cannot under any circumstances be returned.

June 9. Guildford.—Supplying and erecting about 700 ft. lineal of barbed wire fencing with iron standards on the Poyle Charity estate. All particulars can be obtained from William G. Lower, surveyor to the Estate Trustees, 12A, High Street, Guildford, to whom tenders are to be sent on or before June 9.

PAINTING AND PLUMBING.

May 31. Leeds and Stourton.—Painting, &c., the locomotive buildings at Leeds and Stourton, for the Midland Railway. Specification may be seen, quantities and particulars obtained on application at the Engineer's Office, Derby. Sealed tenders to be forwarded by post to the Secretary of the Way and Works Committee, Midland Railway, Derby, not later than 9 a.m. on May 31.

May 31. Poole.—Painting and repairs to lodge and chapels at the Poole Cemetery. The specifications can be seen at the Borough Offices, and also at the Cemetery Lodge. Tenders to be delivered at the Borough Surveyor's Office by 10 a.m. on May 31.

May 31. London.—Cleaning and painting station buildings, &c., at Highgate Road, Junction Road, Upper Holloway, Hornsey Road, Crouch Hill, Blackhorse Road, Walthamstow, Leyton, Leytonstone and Wanstead Park, for the Midland Railway. Specifications may be seen, quantities and particulars obtained, on application at the Engineer's Office, Derby. Sealed tenders to be forwarded by post to the Secretary of the Way and Works Committee, Midland Railway, Derby, not later than 9 a.m. on May 31.

June 1. London, E.—Whitewashing and repainting of the outside walls and ceilings of Nurses' Home, Raine Street, Old Gravel Lane, for the Guardians. Specification and form of tender may be obtained from R. Murray Lochner, clerk, Clerk's Office, Raine Street Old Gravel Lane, E., to whom sealed tenders must be delivered not later than 2 p.m. on June 1.

June 6. Cranbrook.—Repairing and painting the outside wood and ironwork of the workhouse. Specification of the work may be seen on application to H. Fincham, the master. Tenders must be sent to T. H. Crampton, clerk, Cranbrook, on or before June 6.

June 6. Mold.—Painting Bethesda C.M. Chapel, Mold. Specification to be obtained from Jesse Roberts, Bryn Hilyn, Mold, to whom tenders are to be sent not later than 6 p.m. on June 6.

June 6. Hunslet.—Painting and colour-washing required at the Children's Homes at Rothwell Haigh. Forms of tender, with a specification of the work, may be obtained on application to Fred W. Mee, clerk to the Guardians, Union Offices, Hunslet, Leeds, to whom sealed tenders, endorsed "Painting," must be delivered by 10 a.m. on June 6.

June 7. Carmarthen.—Painting, colouring, &c., at the following Council schools:—Llwynhendy, Philadelphia, St. Clears, Trelech Village, Bettws, Capel Isaac, Velinwm, Five Roads. Specifications may be seen and full particulars obtained on application at the above-mentioned schools, or at the office of W. D. Jenkins, M.S.A., M.R.S.I., county education architect, Shire Hall, Carmarthen. Tenders, sealed and endorsed, to be delivered to J. W. Nicholas, County Education Offices, Carmarthen, on or before June 7.

June 8. London.—General repairs and painting to the artisans' dwellings, Stoney Lane, for the Corporation, according to specification and other particulars to be seen at the office of the Engineer to the Corporation, Guildhall, where forms of tender may be obtained. Tenders, on the before-mentioned forms, must be addressed, Town Clerk, Public Health Department, Guildhall, E.C., endorsed "Artisans' Dwellings," and delivered at the office of the Hallkeeper, Guildhall, between 1 and 2 p.m. on June 8.

June 9. Aberdeen.—Lime-washing of courts and closes, of which a specification and list lie at the Sanitary Inspector's Office, 41½, Union Street, and which will be given out for perusal of intending offerors on application any day at 10 a.m. Tenders addressed to the Council, and endorsed "Tender for Lime-washing," to be lodged

with the Sanitary Inspector on or before June 9. The work to be commenced on June 18, and finished by July 21.

June 9. Nottingham.—Outside painting proposed to be done to the gates and the lodges at the Waverley Street and Sherwood Street entrances to the Arboretum. Specifications, forms of tender, and bills of quantities may be obtained on application at the City Architect's Office on payment of a deposit of 10s. Tenders, endorsed "Tender for Painting Lodges, &c., Arboretum," to be addressed to Samuel G. Johnson, town clerk, and delivered at his office, the Guildhall, before noon on June 9. Fair wages clause.

June 12. London, W.—Cleaning, painting and distemping, &c., the interior of the infirmary buildings at Isleworth, for the Guardians of Brentford Union, in accordance with specification, which can be seen at the Union Offices, Isleworth, W. Tenders, endorsed "Painting Infirmary," must be delivered to William Stephens, clerk to the Guardians, not later than 4 p.m. on June 12.

June 12. London, W.C.—Preparing and painting the whole of the external ironwork, and for cleaning out and repairing all the gutters and stack pipes at the Receiving House for Children and Nurses' Home in Broad Street, W.C., for the Guardians of St. Giles-in-the-Fields, and St. George, Bloomsbury, in accordance with a specification to be obtained at the Guardians' Offices, 57, Broad Street, Bloomsbury, W.C., where tenders must be delivered on or before 10 a.m. on June 12.

June 23. Dunham.—Painting Dunham Bridge above and below the roadway, together with the gate-house and outbuildings, gates, fences, &c. The specification may be seen and a form of tender obtained upon application to Scorer and Gamble, Bank Street Chambers, Lincoln, to whom tenders are to be delivered not later than 10 a.m. on June 23.

Note. Tockholes.—Painting outside woodwork of Tockholes Congregational chapel, school, and cottages. Apply to the Pastor, Silk Hall, Tockholes.

ROADS AND CARTAGE.

May 31. Aberdeen.—Macadamizing Canal Place, and laying cement-concrete foot-pavements at Great Western Road, Burnett Place, Belgrave Terrace and Grampian Road. Plans may be seen and specifications, schedules of quantities, and forms of tender obtained on application to W. Dyack, burgh surveyor, Burgh Surveyor's Office, 41½, Union Street, Aberdeen, with whom sealed tenders, properly endorsed, must be lodged before noon on May 31.

June 4. East Stonehouse.—Supply of broken and other stone to be delivered at the yard in Stonehouse Pool, for the U.D.C. Specification and form of tender may be obtained at the Surveyor's Office. Sealed tenders, endorsed "Road Materials," together with samples, must be delivered free of charge at the Surveyor's Office, Town Hall, East Stonehouse, Devon, on or before June 4.

June 4. Winteringham Haven.—Supply of 600 tons of granite, broken to 1½ in. or 1½ in. gauge, delivered at Winteringham Haven, either into carts or shored as may be required, for the U.D.C.; also for the supply of 200 tons of well-broken slag and 50 tons of screenings; and for carting the granite and slag and screenings, either by carts or traction, and deposited in such quantities and where as the Surveyor shall direct. Tenders and samples to be sent to A. Spencer, clerk of the Council, Council Offices, Queen Street, not later than June 4.

June 5. Tynemouth.—Excavating, laying a rubble foundation and paving with Whinstone chips in Huddleston Street, Simpson Street and Back Lane, Cullercoats. Plans and specification may be seen at the office of John F. Smillie, borough surveyor, to whom sealed and endorsed tenders are to be sent not later than noon on June 5.

June 5. Woodford Green.—Providing and laying concrete slabs in footway in Snakes Lane, Woodford Green, for the U.D.C. Estimated quantity, 1,100 yds. super. Plan and specification may be seen and bills of quantities and form of tender obtained from the Surveyor upon deposit of £1 1s. Fair wages clause. Sealed tenders, endorsed "Tender for Footway Paving, Snakes Lane," to be sent in on the official forms to the Council Offices, Woodford Green, not later than June 5.

June 5. London, N.—Supply and delivery of about 8,365 sup. yds. of zin. artificial slab paving, and for supplying and laying about 2,359 sup. yds. of similar paving, for the U.D.C. of Finchley. The Council also invite tenders for supplying and laying such paving of a similar description as may be required by them during the period ending Mar. 31, 1907. Specification and conditions of contract, together with form of tender, may be obtained on application to the Engineer and Surveyor. Sealed tenders, endorsed "Paving," must be addressed and delivered to E. H. Lister, clerk, Council Offices, Church End, Finchley, N., not later than June 5.

June 7. Edinburgh.—Work on the carriageways of Chalmers Street and Saxe Coburg Place (paving with concrete); Torphichen Street (paving with hard whin setts). Schedules of quantities may be obtained on application to the City Road Surveyor, City Chambers. Tenders, sealed within the official envelopes supplied, must be lodged with Thomas Hunter, W.S., town clerk, City Chambers, by 10 a.m. on June 7.

June 8. Hebburn.—Excavating and laying tar macadam roadways, whinstone chip paving, cement foot-paths, channels, &c., in Hedgely Road, Whickham Road, Aln Street, Alwin Street, Station Road, Back Station and Aln Street, Back Alwin and Aln Street, North Back Whickham Road, South Back Hedgely Road, Hebburn, for the U.D.C. Plans, specifications and quantities may be seen at the office of H. Paterson, surveyor, Council Offices, Argyle Street, Hebburn. Tenders, endorsed "Roadmaking," to be addressed to the Chairman of the Building and Sanitary Committee, Hebburn, and forwarded not later than June 8.

June 11. Ilford.—Levelling, metalling, channelling, kerbing, paving and making good Durban, Colenso, Wellesley, Lockwood and Dunedin Roads, Kimberley Avenue, and right-of-way leading from Lockwood Road to

Sunnyside Road, for the U.D.C. Plans and specifications may be seen and form of tender obtained on application to H. Shaw, A.M.I.C.E., surveyor to the Council, at the Town Hall, Ilford, during the usual office hours, on payment of a deposit of £2 2s. Sealed tenders, endorsed "Tender for Private Street Works," are to be delivered to John W. Benton, clerk to the Council, Town Hall, Ilford, on or before June 11.

June 12. Beckenham.—*Tar macadamising of Bromley Road (part of) and Minor Road, for the U.D.C.* The tar macadam is to be 4½ in. thick in two layers, the approximate areas of the two roads being as follows:—Bromley Road, 4,000 sq. yds.; Minor Road, 2,800 sq. yds. Plans may be seen, and bills of quantities, specifications and forms of tender obtained on application to John A. Angell, surveyor, on the production of a receipt from the collector (who attends his office daily from 9 to 10 a.m. only, except on Tuesdays, when his hours are from 9 a.m. to 1 p.m.) for a deposit of £1. Fair wages clause. Tenders, duly sealed and endorsed "Tenders for Tar Macadam," to reach F. Stevens, clerk of the Council, not later than 4 p.m. on June 11.

June 13. Enfield.—*Making-up of the following private streets, for the U.D.C.:—Forest Road, Freezywater, Holmwood Road (part of), Freezywater.* Plans and specifications can be seen, and forms of tender and all information obtained, on application to Richard Collins, surveyor to the Council. Separate tenders for each road (on the forms supplied only) to be endorsed "Tender for —," and sent in to T. W. Scott, clerk, Public Offices, Enfield, not later than noon on June 13.

June 20. Watford.—*3,000 tons of granite (or such less quantity as the Council may require), machine broken, so as to pass in any direction through a 2 in. ring, also an alternative tender for similar granite broken so as to pass in any direction through a 1½ in. ring, delivered in quantities as required, at Watford or Bushey Stations, for the U.D.C.* A sample of granite is to accompany each tender, and the tender is to state the rate per ton of the material. No official tender form will be issued. Sealed tenders, addressed to the Clerk to the Council, and endorsed "Tenders for Granite," to be delivered at the offices of the Council not later than noon on June 20.

No date. Carden.—*Widening Hand Lane, Carden, for the Tarvin R.D.C.* Particulars can be obtained on application to H. Grant Bailey, clerk to the Council Crypt Chambers, Chester.

SANITARY.

June 4. Newport (Fife).—*Construction of a gin, fireclay and iron pipe outfall sewer at Scroggieside, Wormit, with manways and fittings, &c.* Plans may be seen and specifications, schedules of quantities, and forms of tender obtained from the Surveyor on depositing the sum of £1 1s. Tenders, endorsed "Sewers, Scroggieside," are to be lodged with D. A. Donald, C.E., burgh surveyor, Burgh Chambers, Blyth Hall Buildings, Newport, Fife, not later than 10 a.m. on June 4.

June 5. Yeovil.—*Construction of about 500 lin. yds. of 12 in. and 557 lin. yds. of gin, stoneware pipe sewers.* Specification and plans may be seen and forms of tender obtained at the office of A. Odly, borough surveyor, Municipal Offices, Yeovil, to whom sealed tenders must be delivered by noon on June 5, endorsed "Sewers," and addressed to the Chairman of the Sanitary Committee.

June 6. London, N.—*Construction of a 12 in. sewer of about 700 yds. in length, together with manholes and other incidental works, for the drainage of the White Hall Estate, for the Finchley U.D.C.* The proposed works are to be constructed in accordance with plans and drawings, which may be inspected at the offices of the engineer and surveyor to the Council. Copies of specification, schedule and form of tender may be obtained from the engineer on application, accompanied by a deposit of £2. Sealed tenders, endorsed "Works of Sewerage," and addressed to B. H. Lister, clerk to the Council, Council Offices, Church End, Finchley, N., to be sent in not later than June 6.

June 6. Watford.—*Construction of 400 lineal yds. of gin, stoneware pipe sewers and storm-water chain, with the necessary manholes, &c.* Persons desirous of contracting may see the drawings, form of contract, specifications, &c., at the Offices of the Council, 14, High Street, Watford. Sealed tenders, addressed to H. Moreton Turner, clerk, council offices, Watford, and endorsed "Tender for Sewerage," must be delivered under cover by June 6.

June 6. London, W.—*New relief effluent water sewer from southern works to River Thames, and manholes &c., in connection therewith, as under:—about 3,700 ft. of 24 in. pipe.* The drawings and specifications may be seen, and forms of tender, together with schedule of quantities and other particulars, obtained from C. Jones, M.I.C.E., borough engineer, Town Hall, Ealing, W., any day during office hours, upon payment of a deposit of £3 3s. Sealed tenders, in the envelope provided, endorsed "Tender for New Relief Effluent Water Sewer," must be delivered to George E. Brydges, town clerk, Town Clerk's Offices, Town Hall, Ealing, W., not later than the first post on June 6.

June 6. Watford.—*Erection of a three-stall urinal at the "Queen's Arms," Calton Lane, for the U.D.C.* Plans and specification and general conditions can be seen on application to D. Waterhouse, surveyor to the Council, 14, High Street, Watford. Sealed tenders, endorsed "Tender for Urinal," to be delivered to H. Morten Turner, clerk to the Council, 14, High Street, Watford, by noon on June 6.

June 7. Cheadle.—*Construction of about 400 lineal yds. of gin. and 377 lineal yds. 12 in. earthenware pipe sewers, with manholes, &c., at Grove Lane, Cheadle Hulme, for the R.D.C.* Plans and drawings may be seen, and copies of the specifications and bill of quantities obtained on application to E. Sykes, C.E., between 10 and 12 daily until the 31st May (Saturdays excepted), on deposit of £1 1s. Tenders, duly sealed, and endorsed "Tender for Sewers," may be addressed to Arthur Briggs, clerk to Cheadle and Gatley U.D.C., Council Offices, Cheadle, near Manchester, on or before June 7.

June 7. Blything.—*Drainage works for the Guardians.* Works required to be done in taking up the old drains, &c., and laying new system and other works in connection therewith at the Workhouse and Bulcamp, near Halesworth, according to plan and specification prepared by Henry T. Wright, M.S.A., architect and surveyor, Ipswich. Copies, plan and specifications may be seen at Clerk's Office, Bulcamp, any week-day except Saturdays between 10 and 4, and on Saturdays between 10 and 2. Tenders, sealed and endorsed "Tenders for Drainage," to be delivered at the Clerk's Office, Union Workhouse, Bulcamp, Halesworth, not later than 5 p.m. on June 7.

June 7. Blaydon.—*Scavenging, &c., for the U.D.C.* Removal and disposal of scuttle ashes, contents of ashpits, house refuse, &c., at Blackhall Mill and New Chopwell. Specifications, form of tender, and full particulars may be obtained from Robert Biggins, sanitary inspector, at the offices of the Council, Blaydon-on-Tyne, between 9 and 10 a.m. Sealed tenders, endorsed "Tenders for Scavenging Contract," are to be delivered to Henry Dalton, clerk, Blaydon-on-Tyne, on or before noon on June 7.

June 9. Bolton-le-Sands.—*Construction of a gin, iron and earthenware pipe sewer at Bolton-le-Sands, for the Lancaster R.D.C.* Plans and specification may be seen and forms of tender obtained on application to W. Dixon, surveyor, 5, Dalton Square, Lancaster. Tenders to be delivered to W. D. Ball, clerk to the Council, 5, Dalton Square, Lancaster, not later than 10 a.m. on June 9.

June 13. London, S.E.—*Construction of an underground convenience for women in Arnside Street, Walworth.* Plans may be seen, and specification, conditions, and forms of tender and further particulars obtained between 10 a.m. and 5 p.m. on application to A. Harrison, M.I.C.E., borough engineer, Town Hall, Walworth Road, upon payment of a deposit of £1 1s. Fair wages clause. Tenders, which must be on the prescribed form, sealed and endorsed "Tender for Construction of Underground Convenience," must be sent to J. A. Johnson, town clerk, Town Hall, Walworth Road, S.E., not later than noon on June 13.

June 15. Uckfield.—*Construction of the following works, for the R.D.C.* About 10 miles of stoneware and iron sewers, ranging from 8 ins. to 15 ins. in diameter, with the necessary manholes, flushing tanks, &c.; purification works, consisting of covered settling tanks, double contact bacteria beds, storm-water beds, &c., and other works, in accordance with the specification and plans prepared by John Taylor, Sons, and Santo Crimp, civil engineers. Copies of the specification and quantities, with forms of tender, may be obtained from and the drawings inspected at the offices of the Engineers, at Caxton House, Westminster, upon payment of £5 (cheque only). Tenders, endorsed "Crowborough Drainage—Contract No. 1," are to be delivered to Frederick Holman, clerk, 85, High Street, Lewes, on or before 10 a.m. on June 15.

June 19. London, E.—*Cleansing and whitewashing the latrines and urinals at the various schools, for the East Ham Borough Council, as described in the form of tender.*

Specification and form of tender may be obtained at the Education Office, East Ham. The work must be done during the summer vacation. Each contractor must deposit £5 with his tender. Fair wages clause. Tenders, on the printed form, must be endorsed "Tender for Cleansing and Whitewashing," and delivered to H. C. Padgett, secty., Education Office, East Ham, E., not later than 4 p.m. on June 19.

No date. Long Eaton.—*Forming, making, severing, herbing, channelling, &c., extensions of Breodon Street, Curzon Street, and Canal Street, on the estate of the Mutual Land Society according to the plans, specifications, and bills of quantities prepared for the above society by J. F. Dodd, surveyor, Long Eaton.* Contractors desirous of tendering are requested to make application to Herbert W. Sunman, secty., "Ellerslie," Cleveland Avenue, Long Eaton, for copies of the said bills of quantities. Such application to be accompanied by a deposit of the sum of £2 2s.

TIMBER.

June 7. Penrhiwceiber.—*Supply of the following timber for twelve months, for the Penrhykber Navigation Colliery Co. 1:—Pitch-pine deals, red pine (best quality), American birch boards and deals, poplar and elm combs, elm, G. & T. match and flooring boards.* Form of tender may be obtained on application to the Secretary. Tenders to be in by June 7.

MISCELLANEOUS.

May 31. London, E.C.—*Supply of the following stores, for the Great Indian Peninsula Railway Co.:—Platelayers' tools; loco. brass tubes; spring steel; brass sheets, copper pipes, &c.; brass hinges, bolts, &c.; paints, &c.; firebricks.* Specifications and forms of tender may be obtained at the office on payment of the fee for the specification, which payment will not be returned. Tenders must be delivered in sealed envelope, marked "Tender for Platelayers' Tools," or as the case may be, to J. I. Berry, secty., 48, Cophall Avenue, E.C., London, not later than 11 a.m. on May 31.

May 31. Llantrisant.—*Supply of seventy street lamp pillars and seventy glazed lanterns for public lighting purposes, for the Llantrisant and Llantwit Fardre R.D.C.* Quotations will only be received upon the Council's forms, which, together with the specifications and conditions, may be obtained from the Surveyor. Persons desirous of quoting must deposit the sum of £1. Quotations must be delivered to the Council's clerk, W. Spickett, solicitor, Pontypridd, before 10 a.m. on May 31.

June 1. Middlesbrough.—*Supply of stores for the ensuing twelve months:—Bolts and nuts, brushes, galvanized buckets, copper and brass wire and 1 tubs, roofing felts, files, glass, grates, shovels, iron bars, steel sheets, lead nails, oils, paints, screws, wrought-iron steam tubes and fittings, varnish, &c.* Specification and form of tender may be had on application to R. V. Thompson, junr., Stores Superintendent, 42, Commercial Street, Middlesbrough. Sealed tenders, endorsed "Tenders for Stores," to be forwarded to Alfred Sockett, town clerk, Municipal Buildings, Middlesbrough, not later than June 1.

June 2. Hull.—*Supply of all or any of the materials and labour required by the water and gas committee in the execution of ordinary work during the six months from July 1 to Dec. 31, 1905, under the following trades:—Joiner, bricklayer, ironmonger, plumber, engineer and ironfounder.* Forms of tender for the last three appointments may be obtained on application to F. J. Bancroft, Water and Gas Engineer, Alfred Gelder Street, Hull. For the other appointments only ordinary letters of application are required. Applications, endorsed for each trade, to be addressed to the Chairman of the Water and Gas Committee, and delivered at the Town Clerk's Office before noon on June 2.

June 11. Dundee.—*Supply of the following materials for the Water Commissioners:—Contract No. 1: 4,000 tons of cast-iron pipes, 27 ins. diameter. Contract No. 2: Excavator work, &c., in removing over 3,000 tons of existing pipes, and for carting, laying and jointing new mains. Contract No. 3: Disposal of over 3,000 tons of old pipes and broken metal zincs, to 1½ ins. thick.* Drawings, specifications and schedules may be obtained from the Engineer's Office on receipt of £5 ss. No tender will be recognized unless it is made on the prescribed form, properly filled up in every respect. Sealed tenders, properly endorsed for each contract, must be received at the office of W. H. Blyth Martin, town clerk of the city of Dundee and Clerk of the Commissioners, before June 11.

By G. Macfarlane (of Manchester).

President, National Federation of Building Trade Employers of Great Britain and Ireland.

THE purpose of this article is to show the remarkable improvement that has taken place in the conditions of manufacture in joinery work for new buildings during the last fifty or sixty years.

Strictly speaking, as we now use and understand the name in this country the "carpenter" does the heavy framing and outside construction in woodwork, whilst the "joiner" is in the workshop and prepares the lighter and finer class of woodwork required in buildings. In the United States the term carpenter is commonly understood to include that of joiner. In ancient times the name "carpenter" was the comprehensive name for all woodworkers. "Jesus of Nazareth was a common working carpenter till he was thirty years of age."

Specialization.

It is only in modern times, since all kinds of work has become more or less specialized, that the above-mentioned distinction has been made. Even fifty years ago the same individual was generally called a "carpenter and joiner," as he then did both classes of work. Now, however, we have, and have had for a number of years, at least in shops of any size, what is known as "inside" or "bench hands" and "outside hands," a distinct class of workmen although paid at the same rate of wage. As a rule the bench hands are the superior craftsmen, and good workmen retain their situations without much risk if work is anything like plentiful. A good bench hand is always worth his money, and he can generally get it.

The part that modern woodworking machinery has played in lessening muscular labour has principally affected the bench hand and only to a lesser extent the outside hand. But both have gained in increased wages and in shorter working hours; both these advantages became economically obtainable through the introduction and development of labour-saving machines.

Conditions in 1854.

I cannot do better than describe the condition of things as they existed in 1854 in the shop where I went to serve my apprenticeship in a large-sized city in the North of Scotland. This shop was one of the four largest in the town and turned out work equal to any of the other three. None of these shops had machinery of any kind—not even a circular saw. There was, however, a public sawmill in the town with two circular saws, a large-sized log frame for upright saws, and a planing machine for floor-boards that had just been put down. To this mill the trade went to get their sawing done.

Pit sawing was then the general method of cutting up timber from the log into boards. To be a "top sawyer" in those

days was to be a man of importance. Pit sawing was, however, hard heavy work, and to earn good wages the sawyers had to keep close at it, as the payment was as a rule by measure. Although a slow process compared with modern methods, the old-fashioned saw pit died hard. It struggled on for years after the introduction of the upright saw-frame; in the opinion of many there was less waste in the saw-cut than by machinery. But the machine at last defeated the man, as it always does, and the saw pit is now practically extinct in this country.

Cutting up by hand.

Having no power upon the shop premises, all the cutting up had to be done by hand saws in the yard. This was done up to the thickness of 3in. planks. A "rip saw" was an essential tool for each workman to have in those days. I do not know if there are any made now. I have not seen a workman with one in his possession for at least a quarter of a century.

When a number of sashes and frames had to be made the journeyman who had the job, after setting out his staffs and getting the sizes and quantity of stuff that he required written down upon a board, would go downstairs with his board to the yard foreman, who would seek it out for him to rip up. He would most likely, if the job was a large one, have the assistance of the foreman and two apprentices. It was often enough two or three days' continuous ripping, and a heavy and tiresome job. The important point in the hand ripping was to keep straight to the marked line and keep the saw perfectly perpendicular. I can well remember how easy it was to get off the line and to let the saw get off the square, and how difficult it was afterwards to get it straight and back to the upright position. There was in that experience a pretty simile for the moralist. These were troubles that are now practically unknown either to the workmen or apprentices of the present day. Doors and all work of a similar character had all to be cut up by hand in the same way. If you kept steadily at it it brought the sweat out of you, and before 6 p.m. came your back ached.

Dressed up by hand.

After getting all his stuff cut out, the journeyman carried it with the assistance of the apprentice upstairs to the back end of his bench. Then all had to be dressed up by hand, taking the rough face off with the jack plane and finishing with the trying plane, carefully choosing the best face and edge, and after being made exactly square marking the face and edge with a distinctive pencil mark, then gauging each piece of stuff to a uniform width and thickness. To the man who had to do all this planing up it was no light job. In fact, the physical effort of so much planing told so upon most workmen that you could generally tell a joiner when you saw him on the street, as his left shoulder was considerably higher than his right one. This was brought about by the heavy task of planing, the right arm and right side of the body having to bear the heavy strain of bench-work. In time the exertion pulled the body down towards the

work, and as years went on, except in cases of exceptional physical strength, the tendency to stoop became very marked, and round shoulders were the usual thing amongst old joiners. I do not mean to infer that joiners, from the changed conditions of their work, are now entirely free from this physical danger, but it is now minimized most considerably.

Mortising and Tenoning.

When the stuff was all dressed up, after being set out the mortising and tenoning began—the moulding and rebating, in the case of sashes—and in the case of doors the grooving for panels in addition. All the tenoning had to be done by hand, using the rip saw for the cheeks and the tenon saw for the shoulders. In the case of doors the heaviest part of the work was the lock and bottom rails. A device sometimes used to give assistance to the workman's right arm was to fix a small hand vice to the point of the saw, and an apprentice took hold of it and pulled the saw as the man shoved it, working together as if the saw had a handle at each end. A common type of door at this period was the "ogee-moulded" moulded upon both sides on the solid. More pains and skill were required for this work than for planting the ordinary loose moulds round the panels. The sticking of the moulds and the mitering at the angles required not only muscle but skill and deftness of hand.

In making sashes, although the work was not so heavy as in making doors, when moulding and rebating had to be done by hand, it meant tired arms and aching back when evening came.

Mortising-machines

were introduced about this time and became a great boon to the trade. In the shop where I was apprenticed our mortise-machine was a wooden one, and instead of being worked by an iron arm like the modern type it was worked by an iron treadle. The pressure of the right foot upon the treadle sent the chisel into the mortise and a spring upon the release of the treadle lifted the chisel up out of the mortise. This machine was usually worked by apprentices, but was shirked by them as much as possible; it had a way, if your foot slipped off the treadle, of giving a nasty blow on the shin. Only one of the apprentices took kindly to the treadling business. I suppose he must have got into the knack of it. His name was Tom. Tom and a brother of his slept together. The brother told some of the other lads in the shop that he could not sleep at night from Tom kicking him. And when nudged by his brother and told to lie still, he would repeat in his sleep as he kept kicking away, "Doors, doors." Tom had to stand a lot of chaff when this tale got out, and when any of the other lads wanted to vex him he had but to pretend to be treadling with his foot and repeat "Doors, doors." That story is now over fifty years old, and most likely many of those who gave rise to it have gone "where the wicked cease from troubling and the weary are at rest."

Lads had longer hours and had to work harder then than now. Apprentices were also sooner thrown upon their own resources.

Suppose someone came into the shop and asked for a joiner to be sent to do some small repairs. A youth in his second or third year would probably be sent. He would have to scheme for himself how to do the work, measure for his material, go back to the shop and get what he required. It might be two or three days' work, or it might be more. But to come back and confess inability to carry out the work or to ask for superior assistance was a confession of weakness that very seldom happened. It would probably mean some other youth being sent, and the bare idea of another being sent to take on the job, and the chaff and humiliation that would follow, put even the most timid upon their mettle, stiffened their resolution to persevere, made them resourceful and self-reliant. They had, as the proverb puts it, "either to make a spoon or spoil the horn." There was less of that habit of leaning upon others than exists to-day. It is the boy that makes the man; and to train an apprentice to think for himself, to be able to reason out from first principles any sudden or unusual problem that arises, is to place a young man upon a higher plane during the rest of his life. To be compelled to do everything for yourself is to put manhood and self-reliance into a youth, and begets that self-confidence which is absolutely necessary for a thoroughly qualified and efficient tradesman.

Mouldings.

The facility with which modern machinery turns out all kinds of wood mouldings makes the present-day workmen quite unconscious of the task that was accomplished by their predecessors. In the case of large mouldings the work when executed by hand was very arduous. Sometimes two planes had to be made for the one mould, each plane being adapted to do its own part of the work. To sharpen and keep the irons true to the correct profile of mould was also a difficult job. In all mouldings some parts of the iron had to cut away timber during the whole process of "sticking," and other parts did not come into action until the mould was nearly finished. This caused unequal blunting of the iron and a continuous wearing out of shape. The workman had not only the heavy physical effort in pushing the plane along, but also of so sharpening and keeping his irons in order that all the mouldings would be made one shape. To get over this trouble in large moulds sometimes two separate irons were put into one plane; this made the sharpening and grinding easier, and in some cases a second plane was used for finishing after the first one had done all the shaping of the mould.

"Sticking" Moulds

was one of those jobs that most workmen were willing to be without, and although joiners looked rather askance at the introduction of machinery, and in some instances were so actively antagonistic that they broke it up, yet in spite of the foolish opposition which it had to face it came to stay, and is now recognized as having lightened the task and reduced the physical strain that former workmen had to bear.

The young men of the present day have no conception of the kind of work that was done by joiners in the no-machinery days. I have seen men when sticking large moulds stripped to the waist, with the sweat streaming from every pore. To assist the man, a lad pulled a light rope fastened through a hole in the nose of the plane as the man pushed it. I can remember a plane we used to call "Gallop Jack"; it rebated and chamfered sash stuff for factory windows at one operation. It had a handle like a jack plane. "Gallop Jack" had nearly always a hole in his nose through which a rope was fixed, so that there could be a push and a pull going on together. But, back-aching and arm-aching as this sort of work was, it

was not so dreadful as the horsework of planing and jointing, and sometimes grooving and tonguing, spruce floor-boards. This job for a week or two on end was about as hard a physical task as a man could endure. Few would stop at it that could get another job. There used to be a tale told of an old joiner who was dying; whilst on his death-bed he was asked if he freely forgave everybody who had in any way injured him, as he could not expect forgiveness himself if he did not forgive others. "Yes," he said, "I forgive everybody; but there are two things I will never forgive—spruce knots and old nails." Joiners will appreciate the old man's reservation.

The Cost of Tools.

Not only are joiners now spared the laborious task, and physical effort, that their fathers had to bear before the introduction of machinery, but their financial burden in the way of providing tools is also lightened. A joiner's complete chest of tools in the early half of last century cost a small fortune. It was no unusual thing for a man who was "tool proud"—and there were plenty of such men—to have over £50 worth of tools in his chest. In those days a man could not get a job in a first-class shop except he had a good chest of tools. To enumerate all the various planes, ploughs, badger planes, philisters, rebate planes, beads, snipes, sash planes, chisels, gouges, saws, bits, &c., &c., would make a catalogue of very great length, the whole kit making a heavy and expensive boxful. A Manchester builder of the old days made a practice of trying the weight of each newcomer's chest by lifting one end of it by the handle; to his mind the weight of a man's box determined the value of the man. A joiner who had got a job in this builder's shop and had but a poor box of tools, knowing the test that was usually made, took the precaution to put a screw through the bottom of his chest into the floor. When it came to be tried in the usual way it could not be lifted. So satisfied was this gentleman with the man that he immediately went to the shop foreman and told him that they had got a splendid man; he had got such a good chest of tools that he was not able to lift the end of it—an oft-repeated story, showing that to have a "chest" was in those days a *sine qua non* for a duly qualified workman.

A Scotch Story.

Another large employer of joiners in Manchester, a Scotsman, was said to have a leaning towards his own countrymen. When one of them came to ask for a job—so the story goes—the first question put was, "What kirk d'ye gang to?" The man generally knew his lesson, and replied "Grosvenor Square." "Where d'ye sit?" "Fornet the minister." "Oh, weel, bring your 'kist' in the mornin'," was the welcome injunction.

A joiner's "fitting" in those days was a heavy job. The large chest with rope handles at each end is, however, now obsolete. To have a well-made well-filled chest was at one time the ambition of every first-class workman. It was usually lined with polished baywood fitted with polished baywood trays, and the panelling on the inside of the lid was generally a masterpiece. Specimens are still to be seen in museums and such places, but none find their way now into modern workshops. Workmen are now able to carry all the tools they require in a "bass," and they can store away those not in immediate use in a drawer or shelf in the end of their bench.

"Racing."

From fifty to sixty years ago a pernicious practice existed in some workshops, called "racing" or "running." Masters at that time had pretty much their own way, and as usual they were not all model employers; some, indeed, were very hard taskmasters. It was the usual thing in this type of shop to "race" or "run" all new hands by way of testing their abilities. A few old hands

specially expert and speedy at certain kinds of work, such as door- or window-making, were told off to make the pace for the newcomer. The new man would get, say, eight or nine doors or windows to make. The old hand would also get the same number at the same time. Then the race commenced as to who should finish first. If the new man was behind he was told that he was not able to do the proper amount of work required and could not get full money. This racing became such a harass and injustice that workmen began to combine together, for self-protection, to put a stop to the harassing methods of unscrupulous employers. Trade-unions were formed in many instances to suppress local tyranny, and they have done much no doubt to equalize, and it might be said "standardize," their members, and have removed many of the genuine grievances of former times. Human nature is often very selfish, and ever ready to drive a hard bargain when there is the power to enforce it and when it can be done without risk. Now, however, we are told the "swing of the pendulum" is the other way, the policy of "ca' canny" having taken the place of the "running" policy, the slowest man now making the pace. Doubtless there is much exaggeration introduced in arguing against either of these extremes, both of which are equally harmful to workmen and employers. The only proper and satisfactory course under all industrial conditions is to avoid exacting more than is due and, on the other hand, in return to give that which is due, or, to put it in another way, "do unto others as ye would they should do unto you."

Changes due to Modern Machinery.

Modern woodworking machinery has entirely changed the methods of the joiner's workshop. All the laborious work is now taken from the man and given to the machine. The moulding plane is now obsolete. What used to be the thriving trade of joiners' tool-making has dwindled down to a very small business. One man is only employed where nine or ten men used to have plenty of work.

The question might well be asked, How has all this change affected the workman's earnings? Going back to 1854, the time of the Crimean War, in the shop where I was apprenticed a journeyman's wage was 18s. per week and the foreman 20s.; the hours were 56 per week—about 4d. an hour—we commenced work at 6 a.m. and worked until 9 a.m.; had an hour for breakfast, then from 10 a.m. worked until 1 p.m.; had an hour for dinner; and from 2 p.m. worked until 6 p.m. every day except Saturday, when work ceased at 1 p.m., the Saturday half-holiday having been introduced a year or two before this time in Scotland. Now the wages in that city are 8d. per hour and the time worked 51 hours per week.

Wages then and now.

Coming to England. In 1862 the wages in Bolton, Lancs, were 26s. per week, the hours from 6 a.m. to 5.30 p.m., allowing half an hour for breakfast, from 8 to 8.30, and an hour for dinner, from 12 to 1, and on Saturdays work ceased at 4 o'clock, making 58½ hours per week and the wage about 5½d. per hour. Now the wages are 9½d. per hour, the hours for nine months being 49½ and for the three winter months 47 hours, making £1 19s. 2d. in summer per week and £1 17s. 2½d. in winter, an increase of wage in forty-four years equal to £33 per annum, and a reduction of time equal to fifty days of 10 hours each per annum.

These two towns offer fair specimens of what has taken place in the larger towns during the last fifty years. In addition to the higher wages and shorter hours, the work is not nearly so heavy and arduous.

Although workmen are now working shorter hours and receiving higher wages, the prices that employers get for their work have varied very little. This means that the use of machinery has kept the price of the finished

article at a fairly level rate. It also shows that the workman has gained most from the introduction and the now general use of labour-saving machinery. He earns more wages, with shortened hours and with less muscular fatigue.

Prices then and now.

I have before me now an old set of quantities fully priced out. It shows the contract prices for work obtained in competition for the Birmingham and Gloucester Railway in the year 1839. The prices obtained at that time differ very little; if anything they are rather higher than the prices obtained in competition at present. The following are some of the prices for leading articles:—2in. sashes and frames, with oak sunk sills, at per foot, 1s. 6d.; 2in. circular-headed do., 2s. 3d. per ft.; 1½in. four-panel moulded and square doors, 10d. per ft.; 2in. four-panel doors, moulded both sides, 1s. 1d. per ft.; 2½in. six-panel doors, moulded both sides, 1s. 5d. per ft.: the prices for other kinds of work being in the same proportion. To those who know anything of present-day prices it will be seen that the prices ruling over sixty years ago for carpenter's and joiner's work were equal to what can be obtained in competition to-day, although workmen's wages have nearly doubled in that time.

From the above it will be seen that the economy that has accrued from the increased substitution of machine- for hand-labour has not gone into the employer's pocket, the keenness of present-day competition rendering it almost impossible for a contractor to obtain any advantage from the cheapening of work

by labour-saving machines. The gains have certainly not gone to the capitalist in anything like the proportion that they have gone into the pocket of the workman. Taking into consideration the amount of capital required to carry on a moderately large builder's establishment, the risks that have to be incurred from accidents to workmen, and other charges that have to be met, the profits upon work done at the present time are now lower than they have been for more than half a century.

The struggle for existence, notwithstanding all modern improvements, was never keener, and the efforts to get work to keep expensive machinery going have not been so continuously severe for years. As a gentleman in the trade remarked to me the other day, "It is not now a question of what profit I can get out of a job; it is how much shall I have to give away to get a job at all."

Who is Benefited by Machinery.

Mr. Giffen, in speaking some years ago before the Statistical Society upon the progress that had been made by this country, said: "It would not be far short of the mark to say that the whole of the great improvement of the last fifty years has gone to the masses. I think it must be perfectly clear to every unprejudiced mind that the progressive advances the country has made in mechanical contrivance to reduce the demand of muscular energy from the workman has not only eased his body but increased his wage, and made life upon the whole more agreeable and comfortable."

The social reforms that have been made throughout the country during the lifetime

and within the experience of many now living should be looked at and considered as largely brought about by the mechanical progress of this age, and the artizan class has gained more social advantages during the last half century than any other class of the community.

It has been my endeavour to show that labour-saving machinery, if judiciously used, is the workman's friend, both industrially and socially. It may for a time dislocate hand-made manufactures, but ultimately both the public and the workman especially will gain considerably from the economic saving that the machine produces.

One has only to imagine what the condition of things would be if we had to revert to the laborious methods that our fathers had to adopt to realize the vast changes that have been accomplished by the introduction of machinery during the last fifty or sixty years—changes that have entirely transformed the outlook of the worker, and that have made possible the greatly improved social position he now occupies.

THE PICCADILLY HOTEL.

THE photograph given below shows the present condition of work at the new Piccadilly Hotel. On comparing this with the view taken two months ago, and published in our last Contractors' Supplement (April 25th issue), it will be seen that very considerable advance has been made, more especially on the front to Regent Street Quadrant, where the brickwork has now reached the upper floors.

THE GREAT EXCAVATION FOR THE PICCADILLY HOTEL, LONDON. WILLIAM WOODWARD, F.R.I.B.A., AND WALTER EMDEN, JOINT ARCHITECTS.

The Month's Trade.

(Reports by our Special Correspondents.)

THE STONE, GRANITE AND MARBLE TRADES.

These trades remain dull, although there is a slight seasonable improvement. The Board of Trade reports for April are as follows:—Employment in limestone quarries was good in Weardale. It continued fair in North Wales, and it was fairly good in South Durham. In the Plymouth district employment continued to improve, though it was still reported quiet. In the Bath stone quarries employment was slack, short time being worked, and it was bad in the Somerset blue-lias quarries.

As regards other stone, Chert quarrymen in Derbyshire were fully employed and overtime was general. Employment was fair in sandstone quarries in North Wales. It was also fair in the Sheffield district and in grindstone quarries in the Rotherham district and at Normanton. It was better than a month ago at Gateshead, where the weather caused less interruption. In grindstone and building stone quarries in the Rowsley district employment was quiet. It continued moderate in the Cleve Hill road-material quarries. It was moderate at Portland and slack in the Gloucestershire pennant stone quarries. In Forfarshire employment was bad, and short time was general.

Employment in the granite quarries remained dull on the whole in Aberdeenshire, and bad in Devonshire and Cornwall, where the improvement noted a month ago was not maintained and short time was general. Employment in Leicestershire was reported as slightly better than a month ago, when it was fairly good. It was fair in North Wales.

Employment with settmakers was fair in Aberdeenshire, Leicestershire, North Wales and at Edinburgh, and moderate in the Cleve Hill district and at Airdrie.

The returns for imports of stones, slabs and marble, rough, hewn and manufactured, for the month of April, 1906, as compared with the same month in 1904 and 1905, are as follows:—

Tons.			Value.		
1904.	1905.	1906.	1904.	1905.	1906.
99,299	97,768	109,274	£117,562	102,640	115,432

THE SLATE AND TILE TRADES.

There is still no improvement to report during the past month in the slate and tile trades. Enquiries have certainly been somewhat more numerous, but in most cases there have been no fresh contracts. Consequently there is little prospect of any improvement in demand till the end of the year. In London especially the demand has been greater from the suburban and outlying districts, which points to the fact that factories are being transferred to these localities as rapidly as possible, most of them being for well-known firms. This transference has become a somewhat serious matter to the larger merchants in London who hitherto found an advantage lay in the possession of riverside premises, but at the present time this is proving somewhat of a disadvantage inasmuch as these merchants are expected to take the bulk of their supplies from the larger quarries by sea. The result is that the cost of conveying them to the new areas is considerably in excess of the alternative way of having them despatched by rail to the most convenient station.

Westmorland Slates.

The demand for Westmorland slates has fallen off somewhat. Enquiries have been fewer and substitution of a cheaper slate more frequent, as it is almost invariably the roof which strikes attention when a reduction in cost of a building has to be made. The cases have been much more frequent in our

own personal knowledge recently where Westmorland slates (originally specified) have been cut out for purposes of economy. There seems to be a strong feeling among the quarries that merchants are mainly responsible for this state of affairs, but our opinion is that it is entirely due to the necessity for obtaining as much accommodation on a given site at the lowest possible cost.

Welsh Slates.

We understand there is a slight improvement in the demand for slates generally. This is not peculiar to any locality, but applies to England generally, with the exception of London, where the general opinion in the slate trade is that the demand is less than in any part of the British Isles. A difficulty has recently been experienced in obtaining even small quantities of some favorite sizes at more than one of the leading quarries. It may be interesting to learn that only some million and a half sterling has been paid for slates produced outside the British Isles during the last four years, although the import of French slates has increased by about 50 per cent. during the past seven years. As the shipments of slates from Portmadoc average about 120 million tons a year and the shipments from three other ports are about equal, giving an approximate output of about two million tons a year, the foreign incursion into the British market does not appear on the face of it to be very serious.

Tile Trade.

There does not appear to be any general improvement in the tile trade; though some of the larger works in the Broseley district report having received good orders. Judging from the majority of buildings which have been recently completed, or are in course of erection, the tile trade has a fair share, and among architects there is a decided feeling at present in favour of this roof covering. The demand for hand-made sand-faced tiles is apparently continuous. We hear from the Keymer Brick and Tile Co., Ltd., that their stock of sand-faced tiles is absolutely nil, and that they will be unable to execute fresh orders until the beginning of June. The demand for pressed tiles from this district shows an improvement upon that of the corresponding period of last year, and the makers are fortunate in having as many orders for these as they can comfortably execute. They, however, state that contract work in their district is improving both for tiles and red bricks.

Glazed Roof Tiles.

Apparently a demand for glazed tiles, ridges and finials, which are seen so frequently on the Continent, is springing up in this country. They are specified at the present time, we hear, for the new University Hotel (Messrs. Colclutt & Hamp, architects). These tiles are obtained from the Continent, and whilst some are burnt and subsequently glazed over, we hear of one manufacturer who makes these by covering the moulded clay with a chemical composition which gives the desired effect when burnt. These tiles are put only once through the kilns, the burning of the clay and of the glaze being effected simultaneously. As this tends to avoid any variation in expansion during the burning and on subsequent exposure on the roofs, the danger of the enamel cracking or flaking off, which might exist with glazed tiles which have undergone two separate firing processes, would appear to be non-existent. Messrs. Roberts, Ad'ard & Co., of Bermondsey, who have secured the sole agency for these tiles in this country, inform us that artistic finials in various stock patterns or to architects' own designs are made in the same manner by these tile-makers.

THE CLAYWORKING INDUSTRY.

The brick trade continues to be depressed. To the prevailing monotony there are few breaks, and signs of a general revival are as yet not visible. The Board of Trade labour returns for April state that employment on the whole in the brick and tile trades continued slack, but that it was good in the Oldham district and in Norfolk nad Cambridgeshire. It was fair in South Wales, in the Tees and Hartlepool district, and in the Plymouth district.

THE PORTLAND CEMENT TRADE.

"Subject to acceptance within seven days" is a new feature in quotations for Portland cement. This clause has been seen by the writer several times lately, and is naturally subject to comment, as the Portland cement market has been lifeless now for so many years, and the necessity for such a clause shows that the trade has evolved from its lethargic state into one of extreme activity. This change of affairs is not so much due to any exceptional activity in the home building trade, but is more due to the rapidly increasing popularity of concrete as a building material and the new and varied uses for which it is now employed in all branches of engineering. This fact, coupled with the large demands for cement in the leading export markets, including the Pacific Coast of America, has severely taxed the resources of the Thames and Medway manufacturers, who supply the foreign demands.

San Francisco's Demand.

The recent disaster at San Francisco will at some future date be the cause of a large demand for cement, but it is fairly safe to assume that it must be some months before cement will be required in this connection. The offices are only just being reopened, and the municipal authorities will be some little time before they decide on what lines the city will be rebuilt. Architects will prepare their plans, and tenders for construction will be invited, and even in such an energetic country as the United States these things cannot be done in a week. The steel and concrete system of construction appears to have resisted the ravages of the fire, as well as the shock of the earthquake, better than the ordinary brick buildings. This incident is naturally a good advertisement for the qualities of concrete, and is bound to result in this style of construction being employed not only in the rebuilding of the city but also in other parts of the world.

Improvement Abroad.

The improvement in the Portland cement industry is not confined to this country, for reports from the Continent show that the demand has of late been so considerable that winter stocks have already to a large extent been disposed of, and almost without exception German and Belgian manufacturers are quoting substantially higher prices for their various grades, good, bad and indifferent.

Regarding the statistical position of the trade as disclosed by the Board of Trade returns for the four months to April 30th last, it may be pointed out that while the exports for the period increased by no less than 56,267 tons, the imports decreased by 23,937 tons, representing a total tonnage in favour of the country's trade of 80,204 tons.

Prices have well maintained the recent advance mentioned in our last report, and quotations for future delivery show a still higher range.

Although manufacturers are securing better prices, it must not be assumed that this is all extra profit, as it must be borne in mind that the cost of fuel, labour and packages are all dearer than they were a year ago.

THE TIMBER TRADE.

The Board of Trade reports that employment in April with millsawyers and wood-cutting machinists on the whole was about the same as a month ago. Trade Unions with a membership of 4,839 reported 205 (or 4.2 per cent.) as unemployed at the end of April, compared with 4.5 per cent. at the end of March, and 5.6 per cent. at the end of April, 1905. Employment was good at Preston, Northampton, Coventry and Portsmouth; fair at Hartlepool, Sunderland, Huddersfield, Liverpool, Birmingham; improving at Nottingham, Oldham and Burnley; and bad at Hull, Leeds, Wolverhampton, Leicester and Dublin.

The Liverpool Market.

Business in builders' timber in the Liverpool market has been satisfactory, having regard to the season and to local and inland conditions. In the commoner woods, excepting pitch-pine, there has been no approach to a shortage, nor is there at present any indication that a shortage is likely to occur.

The custom of sending timber forward by "liners" has established new conditions of importation and supply, under which white-wood in some form is continually coming forward. The quantities are not so large, per lot, as one of the older timber ships would bring, but the lots are numerous, and have lately come to hand with such regularity that supplies can now be counted on, and business be safely done on the strength of stocks to arrive per liners.

With regard to business done, this, on the whole, has been satisfactory. Inland merchants and builders have lately taken more timber, and prices, as a whole, have been full and firm. The output from the yards continues, and the activity at the railway goods' stations shows that much of the timber is being sent inland. This can be explained by the continued activity in building factories or works in Lancashire and Cheshire.

Spruce and Pine Deals

from St. John, N.B., and Halifax, N.S., have arrived steadily by liners, and timber of this class has sold more freely. The stock in hand is somewhat larger than that held a year ago. The demand continues, with prices firm.

Canadian wood, received by direct shipments from Quebec, has come to hand only in small quantities. Sales have been fairly numerous, and business generally good.

Baltic Red Deals and Boards

have arrived very sparsely. The deliveries have been larger, so that the stock is slightly reduced, but is more than sufficient for the demand, taking recent sales as the basis.

Norway Flooring Boards

have come to hand more freely. The demand for boards of this class has been quiet, so that the stock has increased, and is well in advance of requirements. Prices have, however, hardened more in sympathy with the mood of the market generally.

American Whitewood

in planks and boards has come to hand freely. Wood of good quality has been more inquired for, and deliveries have been on a larger scale. The stock is adequate, and values are well maintained.

Pitch-pine

sawn and in planks has arrived in greater quantities. The deliveries of sawn have been on a larger scale, the demand for this wood having been active. Planks have been in less demand. Hewn has been in good demand. The prices of pitch pine continue full and steady.

Oak

of United States growth has been imported less freely, while the demand has been much more active. Planks have been imported much more freely. Sales have improved.

Birch

in logs has been received in larger quantities.

Sales have been on a larger scale, and the demand is maintained at date. The stock is, however, greater and prices are easier.

Ash

has been imported less freely, and has also been in less demand.

Elm

has been imported in moderate quantity and the consumption has been practically equal to the importation.

Teak

of East Indian growth has been received in logs and planks in less quantity. The demand has improved materially, so that the stock at date is lighter, with values practically unchanged.

Mahogany

of late has come to hand in small quantities and the recent auctions completely cleared the market of some kinds. Old stocks have been drawn upon. Even faulty wood offered as such has sold at full prices. The market continues in a healthy state, there being eager demand for attractive wood, at full prices, and a very fair demand for useful mahogany of almost any growth, at good prices.

A Proposed New Scale of Landing Charges

on deals has for some time past occupied the attention of the Committee of the Liverpool Timber Trade Association. A few days ago, the secretaries to the Association issued a circular on the subject of the proposed new charges to the members of the Association,

in which they stated that the executive committee unanimously resolved to recommend the members of the Association not to accept any bill of lading containing the new clause or to purchase on c.i.f. terms without the stipulation that the goods are landed free of charge to the buyer.

THE IRONMONGERY TRADE.

The Board of Trade returns for April show that employment at Wolverhampton continued bad in the lock and latch trade, and short time was general. It was good on cast-iron hollow-ware, and with makers of iron hurdles and fences. In the hollow-ware trade it continued good at Wigan, fair at Birmingham and slack at Sheffield, and was quiet at West Bromwich.

Employment in the stoves, grates, &c. trades continued fair at Falkirk and quiet at Rotherham. At Glasgow it was still quiet, at Bolton it had improved and was good, and at Leeds it was good.

With nut and bolt makers employment was fair at Winlaton, Birmingham and in South Wales, and had improved at Darlaston. With wire nail, shoe rivet and cut nail makers at Birmingham it was fair. At Black Heath it continued fair with nail workers and quiet with rivet makers.

Employment with wire workers continued good generally, and better than a year ago.

The returns for imports and exports for April 1906, are compared with the same month in 1904 and 1905, are as follows:—

	IMPORTS.			Tons.			Value.		
	1904.	1905.	1906.	1904.	1905.	1906.	1904.	1905.	1906.
Wire nails	-	-	-	3,146	3,591	3,763	£30,996	36,111	36,666
Nails (other than wire nails), screws and rivets	-	-	-	912	1,042	994	16,017	17,136	14,373
Bolts and nuts	-	-	-	483	467	766	6,793	7,568	12,553
	EXPORTS.			Tons.			Value.		
	1904.	1905.	1906.	1904.	1905.	1906.	1904.	1905.	1906.
Nails, screws and rivets	-	-	-	1,929	1,848	2,557	36,555	36,687	46,021
Bolts and nuts	-	-	-	1,365	1,113	1,806	22,491	19,375	32,478

THE GLASS TRADE.

The glass trade continues fair. The Board of Trade reports that employment with sheet-glass makers and flatteners was good at St. Helens, and fair with flint glass makers and plate glass bevellers at Birmingham.

The returns for imports and exports of glass for the month of April, 1906, as compared with the same month in 1904 and 1905, are as follows:—

	IMPORTS.			Cwts.			Value.		
	1904.	1905.	1906.	1904.	1905.	1906.	1904.	1905.	1906.
Window and German sheet, including shades and cylinders	53,893	45,579	69,905	53,893	45,579	69,905	£239,541	187,244	281,773
Plate	46,013	44,799	30,320	46,013	44,799	30,320	187,622	194,318	161,152
	EXPORTS.			Cwts.			Value.		
	1904.	1905.	1906.	1904.	1905.	1906.	1904.	1905.	1906.
Plate	5,120	6,485	9,063	5,120	6,485	9,063	6,697	9,150	13,712

An international exhibition of glass, pottery, and allied industries will be held in Paris from July to October of the current year. The exhibits will comprise raw materials and machinery, as well as finished products. Particulars may be obtained from 19, Rue Saint-Roch, Paris.

THE PAINT TRADES.

The paint trades are fair. As regards materials, the returns for imports and exports for April, 1906, as compared with the same month in 1904 and 1905, are as follows:—

	IMPORTS.			Cwts.			Value.		
	1904.	1905.	1906.	1904.	1905.	1906.	1904.	1905.	1906.
White lead	25,240	24,875	28,113	25,240	24,875	28,113	£20,357	20,126	24,979

The revised Egyptian tariff that came into operation on February 22nd has placed the following duties on painters' materials imported into that country:—Cotton-seed oil, "prime winter yellow," 20½ millièmes per kilog.; cotton-seed oil, refined, and "summer yellow," 18½ millièmes per kilog.; linseed oil, raw, 20 millièmes per kilog.; linseed oil, boiled, 21 millièmes per kilog.; zinc, white (first quality), including "Vieille Montagne," 26 millièmes per kilog.; zinc, white (second quality), including "Nouvelle Montagne," *ad valorem*; red lead, 19 *ad valorem*. 1,000 millièmes, it may be mentioned, equal £11, or 20s. 6d.

THE IRON AND STEEL TRADES.
Recent Progress.

Many and picturesquely varied are the accounts to which we have been treated respecting the markets which are to be called upon for steel to make good the damage at San Francisco. "Cavendo Tutus" is the motto of the ducal chairman of one of our greatest steel corporations, and its purport may well be adapted to apply to the present attitude of the English steel markets.

Our markets are not to be persuaded into violent bull performances on the strength of mere hypotheses. We are content to await the events of the next few weeks, and merchants and manufacturers will not be found wanting in enterprise and activity when a call is made on this country for any quantity of steel of the best that the world produces.

Meanwhile there is no cause for lament in the prevailing conditions, and whether the volume of business emanating from the Pacific coast prove great or small the progress of events is distinctly in the right direction.

There are one or two points, however, which we may put on record apropos of this subject without taking upon ourselves the responsibility of drawing inferences of any kind.

The consensus of opinion appears to be decisive that on the whole the steel structures have acquitted themselves very well, taking into account the extraordinary vicissitudes through which they have passed.

That more steel will be wanted, and in large quantities, may be taken for granted. Still more obvious is the position of the United States as regards its capacity to cope with the prospective demand. Advices from Pittsburg state that the condition of the works, through orders already on hand for the home markets, is one well-nigh bordering on congestion, and that "every mill in Western Pennsylvania is booked up for many months to come."

In Germany the state of affairs which has prevailed during the past month or two bids fair to be well maintained. The home demand is as strong as ever it has been, and through the whole range of the syndicated works there is the same story of full books and retarded deliveries. Nevertheless, Germany is making a spirited bid for San Francisco business, and there is no doubt that they are in a position to handle a pretty large quantity if it should come their way.

Turning to recent happenings in our own industrial centres, we find, whilst there has been nothing exciting to put upon record, the past few weeks have displayed a tolerably active and a satisfactory condition of affairs.

The tonnage of shipbuilding on the Clyde, which is always an index to the state of the steel trade in that district, shows some very pleasing figures.

The new tonnage output in the Clyde for April amounted to 31,650 tons. This is not a record figure, but it is a good one, especially when an estimate is formed by adding it to the tonnage of the previous three months. The output for January-April amounted to 177,260 tons, which is an unprecedented figure in the history of Clyde shipbuilding.

The month opened in Scotland with a pretty brisk demand for structural steel shapes, but there was no appreciable stiffening in prices. In fact, a very satisfactory tone of steadiness prevailed, which subsequent events do not appear to have disturbed. The following prices may be taken as representative :-

Steel angles	-	-	£ s. d.
" bars	-	-	7 0 0 per ton.
Iron angles	-	-	7 19 0 "
" bars (best)	-	-	7 2 0 "
" bars (common)	-	-	7 10 0 "
" bars (common)	-	-	7 0 0 "

Middlesbrough also opened the merry month of May with the cheerful optimism which

is supposed to generally obtain at that period. It is the pig-iron figures which dominate the perspective there, and the retrospect was one which fully justified their bounding spirits. The exports from the district for April are about the best on record. The total showed the imposing figure of 131,340 tons, or 43,000 tons (nearly 50 per cent.) in excess of the tonnage for April last year. Germany took a large portion, bringing the total shipped to that country during January-April up to nearly 100,000 tons. In structural steel there was not a large influx of orders during the commencing days of the month, but works were well employed with orders on hand, and prices kept pretty firm all round. Steel angles were quoted at £6 10s., joists at £6 5s., and iron bars (best) at £7 10s. per ton.

The Birmingham district did not open out with any great degree of briskness. The building trade was reported as being distinctly dull, and consequently the demand for structural steel was far from what this time of the year usually brings forth. Angles ranged from £6 7s. 6d., channels £6 12s. 6d. and joists £6 15s. per ton.

Taking a general survey of the iron and steel trade of this country for the four months of the present year, as represented by the tonnage exported, there are some very interesting and satisfactory figures returned. We select a few representative lines :-

IRON AND STEEL EXPORTS, JANUARY-APRIL, 1905 AND 1906 (TONS).			
	1905.	1906.	
Pig iron	266,650	400,050	
Black plates	18,480	19,450	
Cast-iron	13,725	13,850	
Wrought-iron	13,250	15,800	
Hardware	262,000	310,100	
Galvanized sheets	132,600	150,000	
Steel girders	19,450	37,400	
Steel bars	40,000	57,600	
Iron castings	2,050	2,950	

The Present Position.

So far as the month has advanced nothing very brilliant has taken place in Scotland as regards sales in structural steel shapes. The pig-iron market brightened up considerably, but this is not, of course, a reliable index as regards the lines which dominate in the building trades. A meeting of Scotch makers was held early on at which the question of reducing the official price for angles was discussed. Nothing, however, came of it, in spite of the general slackness in demand, and as matters are proceeding at present the decision appears to be only a case of deferring the inevitable.

In Birmingham a degree of quietness still prevails, but whether it is one of those calms which precede a storm is very much open to doubt. "Marked" iron bars seemed to be the only descriptions which were able to maintain a superior indifference to their environment. The official figure of £9 per ton still survived, although their poor relations, the "common" bars, were reported to be selling at 5s. below their normal £7 per ton. The following may be taken as representing outside quotations for their respective lines:-Steel angles, £6 10s.; steel joists, £7; girder plates, £7 12s. 6d.; mild steel bars, £7 7s. 6d. per ton.

In the Middlesbrough district the early anticipations were pretty well realized throughout. There was no very remarkable increase in demand or stiffening of prices, but the general tone of business was decidedly strong. The prices already mentioned were well maintained, and in steel shapes there was a prevailing impression that advances might be looked for towards the close of the month.

Looking at the trade in the country as a whole, we may describe it as being decidedly steady, displaying no indications of impending degeneracy, and, if we may venture a mild premise, quite likely to amble in an upward direction.

The following list shows a few com-

parisons of current prices with those quoted twelve months ago (all per ton):-

	1905.	1906.
"Marked" iron bars (Staffs.)	£8 0 0	£9 0 0
"Common"	6 0 0	7 0 0
Steel rails (Middlesbrough)	5 5 0	6 5 0
Steel angles	5 15 6	6 15 0
" (Glasgow)	5 10 0	7 0 0

Continental ordinary steel shapes have certainly been very active during the past few weeks, if not actually rampant.

Briskness of business in their home markets appears to have been the cause of their independent attitude towards their customers on this side. All the German works are very well booked with orders, and the quotations for export have, by degrees of modest half-crowns per ton, risen to quite imposing figures of c.i.f. The price we gave last month for rolled steel joists delivered ex steamer Thames, viz., £5 15s. per ton, has swollen to something in the region of £6 2s. 6d. and upwards. Channels show a corresponding advance, present prices for ordinary shapes being about £6 5s. per ton. Steel angles and tees have not gone up to the same extent, and prices now range respectively from £6 10s. 6d. and £6 13s. 6d. upwards.

On the whole these figures do not present anything very attractive to buyers on this side, especially when the slow deliveries are taken into account.

Other Metals.

The Tin market has been indulging in an anticipatory lapse of Midsummer madness, and some of its feats during the present month will be remembered for a long time to come. Starting the month in a mild way with a figure of £182, prices advanced by one, two, three and five pound stages up to £215 per ton. The condition of affairs generally gave rise to considerable doubt as to how the situation was going to develop, and buyers began to hold back, anticipating a drop. Subsequent events have fully justified this reserve. The timely arrival of a good shipment last week put fresh warrants quickly on the market, and prices have receded considerably. The figure for Straits metal (cash) is now comparatively steady in the region of £190.

The price of copper has shown its customary capriciousness, but the fluctuations have not been great either one way or another. Heavy sales have taken place, and reports seem to indicate that the present figures for standard copper of £85 10s. and thereabouts will be well maintained.

Lead has shown a steady advance recently, present prices being well in front of those of a month ago. Soft foreign is quoted at £16 15s., English at 5s. to 10s. per ton higher, pipes at £19 15s. and sheets at £19 5s. per ton.

Spelter has been comparatively quiet, and prices have not varied very much. Present quotations for G.M. are £27 5s. to £27 10s., and about 2s. 6d. higher for special brands.

In galvanized sheets the normal figure of £12 7s. 6d. per ton is fully maintained and frequently exceeded. Buyers who held back in anticipation of a slackening in this line have once more been disappointed and have placed their orders in the region of the above figure.

THE WALLPAPER TRADE.

The wallpaper trade is stagnant. It is not worse, certainly, than last year, but there is no movement either way. Our exports are less than a month ago, and less than a year ago, and still further behind 1904, as the following return of paperhangings for April will show :-

IMPORTS.			
	1904.	1905.	1906.
Cwts.	-	5,504	4,737
Value	-	£14,638	13,222
EXPORTS.			
	1904.	1905.	1906.
Cwts.	9,683	7,811	7,094
Value	£21,569	19,247	17,676

Tenders.

Addressed postcards on which lists of tenders may be sent will be sent post free on application to the Manager, BUILDERS' JOURNAL, Great New Street, Fetter Lane, E.C. Information from accredited sources should be sent to "The Editor" at latest by noon on Monday if intended for publication in the following Wednesday's issue. Results of tenders cannot be accepted unless they contain the name of the Architect or Surveyor for the work.

Alnwick.—Accepted for the whole of the work required in the erection of a new infirmary. Mr. J. Wightman Douglas, Alnwick, and Messrs. Boyd & Groves, Newcastle, joint architects:—
 Elliot Brothers £4,508

Birmingham.—For the erection of shops, bakehouses, &c., in Dale End and Moor Street, for Mr. Alfred Hughes, Messrs. Nowell, Parr, & Kates, architects, Brentford. Quantities by Mr. G. Kenwick, Colemore Row, Birmingham:—

	Estimate	Estimate	Credit.
No. 1.	No. 2.		
J. Smith & Sons	£6,400	£1,978	—
T. Cole & Son, Selly Oak	6,100	1,900	£100
T. H. Kingierlee, Oxford	5,950	1,850	50
W. Sapcote & Son	5,885	1,764	50
J. Moffatt & Sons	5,990	1,800	205
J. Bowen & Son	5,900	1,779	100
T. Lowe & Sons, Burton-on-Trent	5,977	1,627	175
J. Barnsley & Sons	5,845	1,696	300
G. Robinson	5,745	1,598	125
C. Bryant, Small Heath	5,600	1,673	200
T. Rowbotham	5,490	1,627	120
J. Dallow & Sons	5,440	1,610	164
B. Whitehouse & Sons	5,525	1,620	300
John Webb	5,259	1,587	150
R. Fenwick, Ltd.*	5,175	1,545	275
* Accepted. (Rest of Birmingham.)			

Bognor.—For the erection of a house in Nelson Road, Bognor, Sussex, for Mr. G. T. Poock, Chichester. Mr. Blunden Shadbolt, architect, "Allingham," Horley, Surrey:—

A. Tupper & Sons, Chichester	£815	16	10
H. Oliver, Bognor	755	0	0
E. Harfield, Bognor	730	0	0
Booker Brothers, Bognor	635	0	0
E. J. Richardson,* Bognor	587	0	0
* Accepted with slight alterations.			

Byfleet.—For the erection of a house and premises in Church Road, for Mr. A. Sharp. Mr. D. G. Andrew, architect, Bridge Road, East Molesey:—

W. G. Torrant	£2,490		
Higgs & Outhwaite	2,347		
W. A. Smyrk	2,114		
W. H. Brown	1,990		
S. R. Spinner	1,970		
Lane, Son & Farley	1,928		
G. Willis	1,919		
Wallis & Bennett	1,916		
W. Greenfield	1,761		
H. E. H. Buckingham, Ltd.	1,700		
J. H. Tanner	1,675		
H. J. Butt	1,650		
C. Horsell	1,313		

Cardiff.—Accepted for the furnishing of the new municipal buildings in Cathays Park. Messrs. Lanchester & Rickards, architects, London:—

John P. White, Bedford	£2,171	10	0
Desks.			
Waring & Gillow, Ltd., London	1,280	6	6
Chairs.			
Hampton & Sons, London	2,023	16	6
Bookcases.			
Turner & Sons, Cardiff	819	10	4
[Total, £6,295 3s. 4d.]			
[Architects' estimate £6,650.]			

Devizes.—Accepted for the erection of new training stables with drainage installation at London Road:—
 H. Ash, Devizes £2,473

Epping.—For the construction of nurses' and infants' quarters at the Epping Workhouse, for the Guardians. Mr. H. T. Coley, architect, Buckhurst Hill:—

J. Keen	£1,600	0	0
K. Thedon, Theydon Bois	1,485	5	7
Newell & Lusty, Poplar	1,396	0	0
Kenworthy Brothers, Catterham Valley	1,310	10	0
Foster & Son, Loughton	1,300	0	0
Martin, Wells & Co., Vauxhall	1,299	0	0
Wells & Sons, Buckhurst Hill	1,287	0	0
Parren & Sons, Erith	1,281	0	0
Cowlin & Sons	1,275	0	0
T. W. Heard, Buckhurst Hill	1,257	0	0
P. Wood & Sons	1,256	0	0
Fitch & Cox, Enfield	1,250	12	0
E. E. Winch	1,243	8	7
S. Page & Sons, Croydon	1,236	0	0
J. Barker & Co., Kensington	1,209	0	0
R. Warriner, Loughton	1,168	9	0
E. Streathe, Croydon	1,166	0	0
Myall & Upson, Clacton-on-Sea	1,158	0	0
W. Hyde, Norwood Junction	1,140	0	0
J. Whiffin & Sons*	1,134	8	0
Lawrence & Sons, Waltham Cross	1,124	0	0
Woolaston & Son, South Hackney	1,100	0	0
[Architect's estimate, £1,300.] [Rest of Epping.]			
* Accepted.			

Hanley.—For the extension of Glost Stock Warehouse at Trent Sanitary Works, for Johnson Brothers, Hanley. Messrs. E. L. Maddock & Sons, architects, Hanley. Quantities by the architects:—

T. Godwin	£1,139		
T. R. Yoxall	1,128		
G. Ellis	1,110		
Tomkinson & Betterley	1,103		
P. H. Bennion	1,094		

J. Bagnall	£1,040		
Cornes & Sons*	1,000		
* Accepted.			

Lincoln.—For the erection of a Wesleyan school chapel, West Parade. Messrs. Green, Knowles & Russell, architects, Adelphi Bank Chambers, South John Street, Liverpool:—

W. Wright & Son	£2,205	0	0
Halkes Brothers	1,778	0	0
Lansdown & Son	1,752	16	0
Mawer Brothers	1,690	10	0
R. Marriott,* Rushden	1,656	0	0
* Accepted.			

London.—For the alteration and enlargement of the Bethnal Green fire station, for the London County Council:—

C. Wall, Ltd., London, E.C.	£5,626		
E. Lawrence & Sons, City Road, N.	4,969		
Kirk & Randall, Woolwich, S.E.	4,898		
F. G. Minter, Putney, S.W.	4,759		
H. L. Holloway, Deptford, S.E.	4,719		
Holloway Brothers (London), Ltd., London, S.E.	4,662		
Leslie & Co., Ltd., London, S.W.	4,636

NEW LONDON BUILDINGS.

At yesterday's meeting of the London County Council the Building Committee reported the following applications under the London Building Act, 1894, their recommendations as to consent or refusal being appended in *italics* :—

Projecting porch and four projecting balconies in front of No. 17, Hill Street, Berkeley Square, on the application of Hindley & Wilkinson, on behalf of C. (Consent.)

Building at the corner of Horseferry Road and Elver Street, Westminster, on the application of D. B. Hedrick, on behalf of the Board of Officers of the Westminster Dragoons. (Consent.)

Open portico in front of No. 76, Upper Berkeley Street, on behalf of Mrs. B. Cohen. (Consent.)

Two houses on a site on the east side of Elming Road, Camberwell, with the forecourt fences at less than the prescribed distance from the centre of the roadway on the street, on the application of W. M. Proudfoot, on behalf of S. F. Cope. (Consent.)

Working-class dwelling on the southern side of Thorpe Place, Kensington, on the application of W. C. Leese, on behalf of the Kensington Royal Borough Council. (Consent.)

Retention of an iron forecourt railing in front of No. 1, Aubrey Walk, Kensington, at less than the prescribed distance from the centre of the roadway of the street, on the application of F. Selby, on behalf of A. Withers. (Consent.)

Extension of the periods within which the erection of buildings on a site abutting upon the south side of Clapham Park Road and the east side of Park Hill Road, Clapham, was required to be commenced and completed on the application of H. G. Hills, on behalf of the Wandsworth Metropolitan Borough Council. (Consent.)

Porches to Nos. 57 to 75 (odd numbers only) inclusive, Frankfort Road, Heme Hill, on the application of F. Goddard. (Consent.)

Three houses on the site of Nos. 11, 12, 13 and Hobart Place, St. George, Hanover Square, on the application of Boshmer & Gibbs, on behalf of G. Trolle & Sons and Colls & Sons, Ltd. (Consent.)

One-storey shop in front of No. 124, Queen's Road, Peckham, on the application of J. E. Murch. (Refusal.)

Buildings on the south-eastern side of Fulham Road, Chelsea, to abut also upon College Street and Kimbolton Row, on the application of Elms & Jupp, on behalf of Bingham and T. Crapper & Co., Ltd. (Refusal.)

Four houses with porches on the southern side of Ladbroke Park, Camberwell, westward of No. 1, on the application of A. E. Mullins, on behalf of J. Ham. (Consent.)

Buildings on the eastern side of Blendon Road, Phileas, northward of Wernbrook Street, on the application of J. Wernham. (Consent.)

Re-erection of Nos. 21, 22 and 23, Great Pearl Street, Spitalfields, at less than the prescribed distance from the centre of the roadway of Great Pearl Street, and with irregular open space at the rear of No. 23, on the application of W. Gilbert, on behalf of A. Wearing. (Consent.)

Retention of a building at the rear of No. 124, Holland Park Avenue, Kensington, abutting upon Princes Road, on the application of S. J. B. Stanton, on behalf of Holland Park Motor Co. (Refusal.)

Erection of buildings on the eastern side of Richmond Road, Paddington, on the space at the rear of No. 1, Westbourne Grove, on the application of J. A. Gimblett. (Refusal.)

Deviation from the plans approved on November 1899, for the formation of new streets on the Suffolk Farm and Bostal Farm, Abbey Wood, Plumstead, so as to relate to an alteration in the position of Conference Road, on the application of W. B. Sheppard, on behalf of the Royal Arsenal Co-operative Society, Ltd. (Consent.)

New street for carriage traffic to lead from Frog Lane to Barbary Avenue, Hampstead, on the application of Farebrother, Ellis & Co., on behalf of Sir Spencer P. Marjory-Wilson, Bart. (Consent.)

Street, to be used for the purpose of foot traffic only, on the site of Nos. 619 to 631, Fulham Road, Fulham, and connection therewith the erection of buildings, on the application of Polgrave and Co. (Consent.)

Amended plans, dated March 5, May 10 and May 1906, submitted with the application of S. W. Baynes, on behalf of the St. Pancras Metropolitan Borough Council, for the construction of an ash hopper, dust screen to a hopper, exhaust steam pipe from turbines and dust screen to the coal conveyors at the Pratt Street generating station, Camden Town. (Consent.)

Sub-station on the southern side of Randolph Mews, Portsdown Road, Paddington, on the application of Metropolitan Electric Supply Co., Ltd. (Consent.)

Additional Buildings at Colney Hatch Asylum are to be erected at a cost of £62,000 or £197 10s. per bed.

The Society of Architects has been presented by the Corporation of London with a complete set of the commemorative medals which it has struck from time to time during the last seventy-five years. These medals, which will be placed in the Society's reading room, include the following :—1831, London Bridge; 1834, City of London School; 1840, Coal Exchange; 1869, Blackfriars Bridge; 1878, Temple Bar; 1882, New City of London School; 1884, New Council Chamber; 1894, Tower Bridge.

The new Bridge over the Wear at Sunderland is making satisfactory progress. The ston

THE LABOUR MARKET.

Board of Trade Returns for April.

THE Board of Trade returns show that employment in the building trades in April continued to show a general improvement. It was better than a year ago.

Returns received from fifty-nine London employers showed that in the last week of April they paid wages to 11,306 workpeople of all classes, compared with 11,487 in March, and 12,792 in April, 1905. Employment generally was much the same as a month ago, but worse than a year ago. Painters and decorators were fairly busy. Other branches were very quiet.

Returns were received from employers' associations in sixty districts outside London. In rather more than half of these employment was dull generally. At Burnley it was good; at Ashton, Stratford-on-Avon, Exeter and Taunton it was fairly good; and at the remaining towns (rather more than a third of the total) it was moderate or fair. Compared with a month ago, no change was reported in forty-five towns. At Nuneaton and Cheltenham employment was worse, and at thirteen towns, including Burnley, Bury, Birkenhead, Stockport, Swansea, and Dublin, it was better. Compared with a year ago no change was shown in thirty-six towns, in seven employment was better, in seventeen worse.

The following information is based on returns from trade unions and local correspondents:—

Bricklayers.

With bricklayers employment was dull generally, but in most districts showed an improvement on the previous month. Not much short time was reported.

Stonemasons.

Employment with stonemasons was bad generally, but showed some improvement on the previous month.

Carpenters and Joiners.

With carpenters and joiners employment was better in every district, the greatest improvement being shown in Lancashire and Cheshire, and Ireland. Compared with a year ago, there was a slight decline in Yorkshire. The percentage of trade union members unemployed at the end of April was 5.4, compared with 7.4 in March and 7.5 in April, 1905. Employment was dull generally.

Slaters and Tilers.

Employment with slaters and tilers was better than a month and a year ago. Generally it was fair, but it was bad in the northern counties, Yorkshire, Scotland (excepting Glasgow) and Dublin.

Plumbers.

With plumbers employment was better in all districts, the greatest improvement being in Ireland, Wales and Monmouth, and the eastern, southern and south-western counties. Compared with a year ago some decline was shown in London and the Midlands. The percentage of trade union members unemployed at the end of April was 9.0, as compared with 11.1 in March and 11.2 in April, 1905. Generally employment was bad.

Plasterers.

Employment with plasterers showed a further improvement. It was dull generally, but was fair at Oldham, Bolton and Belfast, and in Scotland.

Painters.

Owing to spring cleaning and Easter holiday work, painters were busy and were better employed than a month ago. Overtime was worked in many cases.

Labourers.

Labourers were rather better employed. Generally employment was quiet.

A. Done by bricklayers.

Builders' Notes.

Mr. William Atkinson (of Messrs. Welch & Atkinson, surveyors, of 10, Lancaster Place, Strand) has retired from the firm, the business of which will be continued at the above address under the old name by Mr. George Stephenson who has for several years been a member of the firm.

A Scottish Contract.—The British Aluminium Co. have given a contract to Messrs. M'Laughlin & Harvey, of Belfast, to build 207 workmen's and officials' houses for them at Kinloch, Leven, in connection with their works there. Operations are to commence immediately.

A Sale of Freehold Building Land at Welwyn is to be held by Messrs. Hampton & Sons at the Mart, Tokenhouse Yard, E.C., on June 26th, at 2 p.m. This land, known as the High Welwyn Estate, will be sold in lots of one-half acre to 17 acres. The estate is 300ft. to 400ft. above sea-level and command fine views of the country round.

Dunfermline Masons.—A year ago the wages of builders in the Dunfermline mason trade were reduced from 9½d. to 8½d. per hour, and those in the hewing department from 9d. to 8d. There have been negotiations between masters and men, and as a result of a conference held last week, a renewal of the old agreement was signed.

The British Uralite Co. of London have appointed Messrs. Parnall & Sons, Ltd., of Narrow Wine Street, Bristol, as their agents for Bristol, West of England, and South Wales. Messrs. Parnall & Sons, Ltd., are an old established firm of shop fitters and weighing machine manufacturers, and they propose holding stocks of "Uralite" in Bristol and various other centres, so that builders may be able to obtain prompt delivery of material required for urgent jobs.

A New London Hotel.—A palatial private and residential hotel with public restaurant de luxe is to be erected on the site of Wellington House, Buckingham Gate, recently vacated by the War Office. The building will have a frontage of 177ft. to Buckingham Gate with a return frontage to York Street of 144ft. The public restaurant will be entered from the apex of the building—the site being triangular—and the hotel proper from Buckingham Gate. The fittings and appointments will be of a sumptuous character, and the hotel will be provided with three electric passenger lifts, goods and service lifts. The elevations will be carried out in cherry red bricks and terra cotta dressings and enrichments with "dragged" surface. The cost of the scheme, including site, will exceed £100,000. Mr. Charles Gray, of Kensington and Shepherd's Bush, is the contractor, and Messrs. Palgrave & Co. are the architects. The work is to be commenced immediately.

Architect to Llandaff Cathedral.—The Dean and Chapter of Llandaff have appointed Mr. F. R. Kempson consulting architect to the Cathedral. Mr. Kempson received the early part of his professional education at Llandaff as a pupil of Messrs. Prichard & Seddon.

Dr. Gore on Church Brasswork.—Addressing the Birmingham art students last week the Bishop of Birmingham said that, going about from church to church, he saw so much brasswork on which so much money had been lovingly spent—altars, eagles, lecterns and screens—almost without exception mechanically ugly, formless, barren of ideas, turned out at so much a yard. There was hardly any of it they would wish to retain, or which they could think of handing down to generations yet to come without a sense of shame.

Builders' Current Price List of Specialities.

This list is not intended to promote undercutting, and prices are subject to discounts for a quantity and for cash. Readers are advised to write for these discounts. Where prices for goods are standardised and fluctuation takes place in trade discounts, our prices have the discounts deducted. In some cases it is difficult for firms to quote prices, and we have stated where they will be pleased to send catalogues and quotations immediately on receipt of applications.

Lighting and Heating:									
Electric light and gasfittings, &c.	—	Young & Martin, Ltd.	Stratford, E.	—	—	—	Prices on application.		
Lightning Conductors	Copper tape	Joseph Lewis	5 & 6, Great Winchester Street, London, E.C.	¾ x ½ and upwards.	—	foot run	from 1s.	—	—
Locks:									
Coin Collecting	Bright brass or bronzed	New Century Co.	235, High Holborn, London, W.C.	14ins. x 4½ins.	—	each	—	—	35s.
Kaye's Patent	Four lever mortice, iron and brass.	Joseph Kaye & Sons, Ltd.	93, High Holborn, London, W.C.	—	—	each	—	—	7s. 6d. 10s. 6d.
"C. and B."	Registered mortise Nos. 1, 2, and 3.	Colledge & Bridgen	Midland Works, Wolverhampton.	6 inch	—	dozen	—	—	£3 6s. £2 5s. £1 9s.
Mantelpieces:									
White Wood	With overmantel	The Hardware Trading Co.	12, New Oxford Street, London, W.C.	Opening 38 x 38.	72ins.	each	£2	—	—
Marble, Mosaic, and Stone Work:									
Glass Mosaic	Coloured art	The Cloisonné Glass Co.	40, Berners Street, W.	—	—	sq. ft.	—	From 3s.	—
	Plain or to design	J. & H. Patteson	7, Bayley Street, Bedford Square, London, and Oxford Street, Manchester.	—	—	—	Prices on application.		
Motor Wagons	Steam	St. Pancras Ironworks Co., Ltd.	171, St. Pancras Road, London, N.W.	—	4 tons 19cwt.	each	—	From £530.	—
Paint:									
"Japonika," Enamel	Elastic, impervious, covers goyds. sup. per gal.	John Line & Sons, Ltd.	Alfred Place, Tottenham Court Rd., London, W.C.	—	—	gallon	18s.	—	—
Anti-corrosive, &c.	"Bitumastic" solution and enamel.	Wailles, Dove & Co., Ltd.	Newcastle-on-Tyne, London, Liverpool, Cardiff, Birmingham, and Glasgow.	—	—	—	Prices on application.		
Partitions:									
Dovetail Corrugated Steel Sheetting.	For partitions, reinforced concrete, &c.	The Fireproof Co., Ltd.	10, York Buildings, Adelphi, W.C.	All sizes	All weights.	sq. yard	From 1s. 3d.	From 1s. 3d.	1s. 3d. plus rail.
Partitions	"Kulm" slabs	H. W. Cullum & Co.	Craven House, Kingsway, London, S.W.	—	—	sq. yard	Prices on application.		
Patent Plaster	Hollow interlocking blocks	Havelock Patent Plaster Partition Co.	63, Finsbury Pavement, E.C.	29 x 17	70lbs. super. yard.	super. yard.	3s. 6d.	4s. 6d.	6s.*
Plaster	Partition slabs	Jabez Thompson & Sons	Northwich, Cheshire	12 x 12 x 2	—	sq. yard	3s. 6d.	4s.	—
Porous Brick	Porous terra-cotta blocks	Hempstead Patent Brick Co.	Hemel Hempstead	9 x 12 x 1½	—	sq. yard	2s.	2s. 4d.	—
Terrawode Brickwood School	Partition bricks	Jabez Thompson & Sons	Northwich, Cheshire	9 x 4½ x 3	2 tons	1000 sq. ft.	£3 5s.	£4 9s.	—
	—	John Stones	"Rosside," Ulverston	—	—	—	Prices on application.		
Pavement Lights	Prismatic	St. Pancras Ironworks Co., Ltd.	171, St. Pancras Road, London, N.W.	—	—	per ft. super.	—	From 4s. 6d.	—
Photo Prints, Copies, &c.:									
"True to scale"	(Dorel system)	W. F. Stanley & Co., Ltd.	13, Railway Approach, London Bridge, S.E.	Imperial	—	2 copies	—	—	2s. 3d. p free
True scale	Dorel and photo-litho methods.	Vincent, Brooks, Day & Son, Ltd.	48, Parker Street, Kingsway, London, W.C.	—	—	—	Prices on application.		
All Kinds	On any material	London Drawing and Tracing Office.	98, Gray's Inn Road	—	—	—	Prices on application.

Builders' Current Price List of Specialities—(continued).

Goods.	Description.	Merchants or Manufacturers.	Address.	Size.	Weight.	Quantity. per	Price			
							On Rail.	Divrd. at London Termini	Divrd. to Buyer.	
Pipes:										
Columbian	Armoured cement for water and sewage conveyance.	Columbian Fireproofing Co.	37, King William Street, London.	—	—	—	Prices on application.			
Drain (iron)	Immense assortment of fittings stocked.	Burn Bros.	Rotunda Works, 3, Blackfriars Rd., London, S.E.	2 to 6	L.C.C. weights.	—	Prices on application.			
Pipe joint paste	"Wisconsin" Graphite	G. F. Hopkins & Co.	112, Westminster Bridge Road, London, S.E.	—	—	1 lb. to 60 lbs.	1s. 1d. to 6½d.	—	—	—
Plaster:										
Fibrous, &c.	For relief decoration	G. and A. Brown, Ltd.	167, Hammersmith Road, W.	—	—	—	Prices on application.			
Keene's & Parian	—	Associated Portland Cement Manufacturers (1900), Ltd.	Dixon House, 72, Fenchurch Street, E.C.	—	—	—	Prices on application.			
"Pytho"	For interior plastering	Plaster, Brick, and Stone Co., Ltd.	Wall Grange, near Leek, Staffs.	—	1 ton	—	37s. 6d.	42s. 2d.	—	—
Rainwater Heads and Pipes:										
Rainwater Heads	Cast lead and iron	George Wragge, Ltd.	London and Manchester	stock designs.	—	each	From 16s. 6d.	17s. 6d.	—	—
Roofs:										
Rubberoid Roofing	High-grade prepared roofing	Robert W. Blackwell & Co., Ltd.	59, City Road, London, E.C.	36×72	40lbs. to 100lbs.	216 sq. ft.	—	½ ply, 17s. 4d.; 20s. 6d.; 2 ply, 31s. 6d.; 3 ply, 41s. 6d. From 6d. upwrds.*	1 ply, 20s. 6d.; 3 ply, 34s. 6d.	—
Steel	Principals and corrugated iron	E. F. Blakeley & Co.	Vauxhall Ironworks, Liverpool.	—	—	ft. super.	—	—	—	—
Sanitary:										
Engineers' Appliances	Baths, lavatories, closets, pipes, cisterns, pumps, &c.	Young & Marten, Ltd.	Stratford, E.	—	—	—	Prices on application.			
Syphons and Tanks	Automatic flushing	Adamsez, Ltd.	Scotswood-on-Tyne	—	—	each	£1 to £3	—	—	—
Waste Preventors	"Paisley," painted	Doulton & Co., Ltd.	Lambeth, London	2 gallon	—	each	£1 3s. 6d.	—	—	—
Waste Preventors	"Well," painted	Doulton & Co., Ltd.	Lambeth, London	2 gallon	—	each	16s.	—	—	—
Scaffolding:										
Putlogs	Hewn birch	Vigers Bros.	67-68, King William Street, E.C.	—	—	dozen	5s. 3d. in docks.	—	—	—
Shutters:										
Revolving	No. 7 convex wood lath	Clark, Bunnett & Co., Ltd.	New Cross Road, London, S.E.	—	—	ft. super.	1s. 6d.	—	—	—
Signs	Anything and Everything	H. B. Torode	22, Henrietta Street, Strand	L.C.C. regulation size	—	—	Prices on application.			
Sinks:										
Glazed Ware	"Krator," "Helios," "Bel-fast" and "Edinburgh."	Adamsez, Ltd.	Scotswood-on-Tyne	—	—	each	10s. to £5.	—	—	—
Slates and Slating:										
"Arlon" Slates	Unfading green	Pearson Bros. & Campbell	18, Water Street, Liverpool	—	—	—	Prices on application.			
Buttermere or Cumberland and Westmoreland Green Slates	Light sea green, olive, and dark.	Buttermere Green Slate and Stone Works.	Keswick	30 to 12 long.	—	ton	£4 5s.	£5	—	—
Slating and Tiling	All kinds—green slating speciality.	Roberts, Adlard & Co.	London, Faversham, Brighton, &c.	as required	—	1,000	Prices on application.			
Slates and Slating	Portmadoc, French and American.	Young & Marten, Ltd.	Stratford, E.	—	—	—	Prices on application.			
Sound-Proofing:										
Deafening Quilt	Cabots' double ply	Arthur L. Gibson & Co.	19/21, Tower Street, Upper St. Martin's Lane, London, W.C.	—	120 lbs.	bale, 500sq. ft.	36s. 6d.	—	—	—
Springs:										
Door Checks	"Blount"	Charles Winn & Co.	Birmingham	—	—	—	Prices on application.			
Stone:										
Bramley Fall	Sandstone, light and grey	B. Whitaker & Sons, Ltd.	Horsforth, near Leeds	any sizes	14ft. to 1 ton.	cube ft.	rod.	1s. 9d.	—	—
Granite	Architectural and monumental.	Kirkpatrick Brothers	Trafford Park, Manchester	—	—	—	Prices on application.			
Dark-Bed Hopton Wood	Hard limestone, colour grey	J. Hodson & Son, Ltd.	Nottingham	random blocks.	—	foot cube	1s. 2d.	2s.	—	—
Yorkshire	Sandstone, various colours	J. Hodson & Son, Ltd.	Nottingham	random blocks.	14ft. cube to ton.	foot cube	From 2s.	From 2s. 10d.	From 3s.	—
Staircases:										
Spiral	—	St. Pancras Ironworks Co., Ltd.	171, St. Pancras Road, London, N.W.	From 3ft. 6ins. in diameter.	—	per ft. rise.	—	From 13s.	—	—
Terra-cotta:										
Window Heads	Buff or red	Walwyn T. Chapman	Cleethorpes	3×9 4½×10.	1cwt.	each	5s.	—	—	—
Tiles:										
Coloured Enamelled	Best quality in brown, blue, green, &c.	Carter & Co.	Encaustic Tile Works, Poole.	usual sizes	1 ton	55yds. sup.	10s. 6d. per yd.	11s. per yd. sup.	11s. 2d. per yd.	—
Tessellated	Best quality any plain pattern	Carter & Co.	Encaustic Tile Works, Poole.	usual sizes	2 tons	80yds. sup.	5s. 8d. per yd. sup.	5s. 4d. per yd. sup.	5s. 6d. per yd. sup.	—
Decorative	Floor	Craven, Dunnill & Co., Ltd.	Jackfield, R.S.O., Shropshire.	every size	56lbs.	sq. yard	from 3s. 6d.	4s. 6d.	4s. 6d.	—
	Wall	Ditto	Ditto	—	40lbs.	—	from 5s. 6d.	6s. 4d.	6s. 4d.	—
	Mosaic	Ditto	Ditto	—	48lbs.	—	from 12s. 9d.	15s.	15s.	—
	Faience	Ditto	Ditto	—	170lbs.	—	from £1 3s.	£1 5s.	£1 5s.	—
"Opalite"	Opal glass, with Sheldermine backing.	Wm. Griffiths	126, Hamilton Ho., Bishops-gate St. Without, E.C.	9×3 and 6×6.	—	sq. yard	—	—	10s. 6d.	—
Wall	Patent undercut back	T. & R. Beote, Ltd.	Burslem	6×6	50 lbs.	sq. yard	6s.	6s. 6d.	6s. 9d.	—
"Durolite"	Glass tiles, with patent fire-proof backing to prevent surface cracking.	Durolite, Ltd.	36, Camomile Street, London, E.C., and St. Helens, Lancashire.	white and tinted 6×6 and 9×3 marbles 12×6 30ins. x 24yds.	—	sq. yd.	—	—	white 10s. 0d. tinted 11s. 6d. marbles 12s. 6d.	—
Tracing Cloth:										
"Ivorie"	Pure white	Norton & Gregory, Ltd.	Castle Lane, Westminster	—	—	roll	—	—	—	—
"Koh-i-noor"	—	L. & C. Hardmuth	12, Golden Lane, London, E.C.	30, 36, 40, 42, 30ins. x 20yds.	—	roll of 24yds.	Prices on application.			
Urinals:										
Glazed Ware	Circular slab and T-backs	Adamsez, Ltd.	Scotswood-on-Tyne	—	—	—	£3 to £15	—	—	—
Ventilators:										
"Acme" and Spherical	Exhausts and intakes	Acme Ventilating & Heating Co.	35, Tarleton Street, Liverpool.	6ins. to 24 diam. tube	—	each	—	—	17s. 6d. to £15.	—
Boyle's Patent	Latest "air-pump" ventilators (design No. 175).	Robert Boyle & Son	London and Glasgow	24ins. to 54ins. diam. jaws 9 ins. opening 12	—	—	—	—	25s. to £18 18s.	—
Vices:										
"Lightning"	Instantaneous action	C. Nurse & Co.	181-183, Waltham Road, London, S.E.	—	50 lbs.	each	17s.	—	—	—

Errors of the Craftsman. By this time we have had a surfeit of the nonsense about art and architecture talked by the amateur, the painter and the craft-worker. The ideals of their school of thought are the legacy of a few energetic spirits of the past, such as John Ruskin, William Morris, Pugin and other leaders of the Gothic Revival. These enthusiasts served a good purpose at the time, as all reformers do, but we cannot follow them to the lengths they went. Their practice was good in many directions, but this does not prove that all their ideas were correct; rather we should say that their practice was better than their theory, and that good results were obtained in spite of their ideals. The fact is, the craftsman—a man who works with his own hands and does things in their entirety himself—is unable to appreciate the necessities of a co-operative craft such as architecture. It is impossible for any one man to execute a whole building. He may design it, but other hands have to carry it out, and it is both impossible, and indeed it would be detrimental, to expect every worker to have a share in the design and conception of the building. The architect is the master craftsman, equivalent in position to the admiral or the general-in-chief, whose talents are the ability to direct and plan the scheme upon which the energies of the executants shall be put forth. Just as

a good general or a good admiral must be a master of every branch of the service, so must the real architect be thoroughly acquainted with all the crafts, but as we do not expect the first to be better at each and all the different occupations than those he directs, neither is it necessary for the architect to be a better craftsman than all those under his direction. We have an article before us which typifies the nonsense that is talked by the artistic craftsman. This is published in the first number of a journal which has just made its appearance with the title of "The Bond." The following are some of the statements in this article:—"The distance of the architect from his work, unless he is his own builder, implies the impossibility of getting the proper control of the materials he uses. The dressing of stone or any other material will be subject to the builder's men that he employs, even if he has faint intuitions about the importance—the incalculable importance—of surfaces. How is he to get his way? The builder he employs to-day will be employed to-morrow by another architect with totally different views. The danger of exalting craft for itself is a very serious one. Unless craft is informed with the 'idea,' it is, as rightly seen by Plato, a very low thing. In art, it is the least part that can be learned. Is there any way in which, instead of talking about it, architecture could really become the leader of the arts? Because at present every other craftsman is nearer to his work than the architect." The first mistake this writer makes is that there is a great difference in the method of working stone. The craft of masonry is simple, tools are used only in a few ways, and the scientific cutting of stone is easily learned. It does not require much practice for the architectural student to obtain the knowledge of the properties of stone by actual practice, and an architect who has thus worked, of which there are many, and who has studied scientific stonecutting, can give instructions to the craftsman as to what surface or form he desires; and so it is with other crafts. The reference to Plato in respect to the importance of idea and the minor importance of craft disproves the writer's own argument, and supports our contention. The craftsman is too close to his work to be able to train and develop those large ideas which are necessary in architectural design. The fact is that the architect is a craftsman on a large scale. His craft is architecture, of which the craftsmen in the smaller branches of building have no notion. Modern building calls for much greater knowledge from the architect than in the past, and he cannot be so close to the craftsman as formerly, but it is not impossible for him to have a mastery of the uses and methods of all branches, for our requirements in architecture have by no means reached the limits of human intelligence, and modern methods of education enable a

man to obtain knowledge in a few months which formerly took years to acquire. We all appreciate in Nature the fact that more complicated structural form presents more opportunities for defects, but we are not caught by surface defects, so that we value less highly forms imperfect, even deformed or deficient in parts, than those perfect in detail which are lower in the scale of evolution. Many craftsmen from inability to appreciate modern work betray a narrow outlook and merely show their ignorance.

Some Ideas from Mr. Shaw. SOME remarks of Mr. Norman Shaw, R.A., made in the course of an interview given last week to a representative of the "Daily Chronicle," are suggestive in connection with the foregoing. Mr. Shaw is very hopeful of the work of modern architects and of the architecture of the London of the future. He was full of faith in the impulses and even the achievements of our time. "Everywhere," said he, "I see energy, energy, energy. We make mistakes certainly, but after all it is not absolutely impossible to pull a building down. Nearly every beautiful building in the world replaced another. William of Wykeham destroyed some splendid old bits of Winchester Cathedral—and set better in their stead. Above all," Mr. Shaw contended, "our architects are working nowadays in what seems to me the right direction towards the evolving of what we have needed so long—a characteristic modern English style. They are beginning to devote themselves to structure instead of thinking, as used to be the case, that it was beneath an architect's dignity to do anything else but 'lay on the trimmings.' So far as I can see the reason why Victorian architecture has so poor a record is simply because our architects were jumping about from one foreign style to another—trying to find a tradition instead of making one of their own. I think Ruskin did a great deal of harm. On the other hand, what is needed, and what I think is being done, is the evolving of a native English style of architecture—domestic at any rate—based upon our own climate, our own materials, our own ways of life, and our own landscape. The arrival of steel girders is enormously important. They might be used quite boldly and characteristically, and with the most graceful results. The Americans have not turned them to very lovely purposes, but there is no reason where we should not, if only we are not ashamed of them. Everything will be evolved if we really love our own life and endeavor it to ourselves. Everything has its artistic uses. Did not London smoke give us Turner? It is intensely important that in great matters, as in small, the use and structure of the building should be the basis of every kind of ornament that is demanded. It is no good having ornaments that are merely ornaments, and not structural."

S.K. EXAMINATIONS IN BUILDING CONSTRUCTION.—STAGE II.

[Not more than six questions to be answered. The value attached to each question is shown in brackets. Time of examination, four hours.]

*21. Make a neat tracing in ink of the drawing, Fig. 21, with the writing and figures. The lines should be firm and solid and should finish accurately at the proper points. (30)

FIRST FLOOR PLAN.

22. Describe fully the preparation of the trench, the mixing and the laying of the concrete, and the laying and jointing of the pipes in a straight run of 4 in. glazed stone-ware house drain laid at an average depth of 3 ft. Draw, half-full size, a longitudinal section through one of the joints. (25)

The trench should be dug wide enough to allow for working room. If the earth is of a very loose character it will require shoring up, but in ordinary soils this will not be required for the depth given. The bottom of the trench is brought to a regular gradient by "boning" between points given by spirit-level agreeing with the working section. Any specially soft parts in the bottom of the trench should

be dug out and replaced by suitable material well rammed. The concrete should be mixed on a clean platform. The aggregate, which should not be coarse for this purpose, should first be spread out on the platform in a uniform layer, and the proper quantity of cement spread upon the aggregate. The whole should now be turned over by men with shovels ("tossed"), at least twice in a dry state and as often as appears to be necessary while the water is being applied. The concrete is then placed on the bottom of the trench to the requisite thickness, and the surface floated to the proper gradient. When the concrete has set, the pipes are laid upon it with the sockets uphill. The pipes are fitted as tight "home" as possible, the joints caulked with gasket, and filled and finished flush with cement-mortar. The body of the pipe between the sockets is flushed in with concrete and finished to the specified section. When the concrete is sufficiently set (and the drain tested) the trench is filled in, using the finer stuff around the pipe, and the upper layers rammed. When no caulking material is used the inside of the pipes at the joints should be carefully scraped clear of the cement.

[Note.—There are various kinds of pipes, self-jointing and otherwise; the description above deals with the ordinary spigot and socket pipe jointed with cement-mortar.]

23. Draw to a scale of $\frac{1}{12}$ (1 in. to a foot) the elevation of 4 ft. run of a half-brick honey-combed sleeper wall eight courses high, including footing, and the ends of four joists suitable for a span of 6 ft.; also draw a cross-section of it showing the sleeper and joist. Show the joints of the brickwork and state under what circumstances a damp-proof course would be required. (25)

See drawing above. A damp-proof course is required when the subsoil is wet, and when the footings are laid directly upon it without a concrete footing or sub-floor.

24. Sketch on your squared paper a hand-mortising machine for working timber, and describe how it is used. (25)

The sketch shows both a chisel and an auger; it also illustrates the various motions of the bed on which the work is placed. The handle of the balanced lever is moved downwards; this brings down the chisel A by a rack-and-pinion movement, thus cutting

the mortise. The piece of timber is held on the bed by the screw C, which is adjustable by means of the slot shown. Right and left feed-movements are given by means of the

wheel D. The chisel is reversed by the small lever shown on top. The wheel E regulates the distance of the mortise from the face of the timber.

[Note.—A candidate would not be expected to give so elaborate a sketch, and he would be wise not to attempt to give unnecessary detail.]

*25. The diagram, Fig. 25, shows a three-light opening in a ground-floor room: the centre is to have a pair of French casements opening inwards and the side-lights double-hung sashes. Draw to a scale of $\frac{1}{12}$ (1 in. to a foot) a plan through the central and one side opening showing frames, casements, &c., and a vertical section to the same scale through the bottom rail of the French casement. (30)

See drawing at the foot of this page.

Q 25.

26. Explain fully what is meant by the terms "render, float and set" on brickwork. Describe the composition of the stuff used for each operation, and the mode of executing it.

(25)

Rendering is the first rough coat of plaster, usually roughened on the surface, i.e., "scratched"—in some localities called the scratch coat. Floating is the levelling-up coat, the surface of which is brought to a true plane, free from pits or hollows, by means of the "float" traversing the screeds which are previously set in the plane of the finished plaster. The "setting" coat is the last coat for giving a finished surface; it is applied with a plasterer's steel trowel and worked smooth, water being applied with a brush as required. "Render, float and set" specifies that the work is to be rendered, floated and set as above described. The plaster (called coarse stuff) is a rough mortar made of lime-putty and sand in the proportion of 1 of lime to 1 or 2 parts sand, thoroughly mixed with ox-hair (well-beaten to loosen it) in the proportion of 1 lb. of hair to 2 bushels of mortar. Coarse stuff is generally used for the rendering and floating coats. The setting-coat may be of fine stuff (lime-putty with a proportion of fine sand, and sometimes a small quantity of hair), "grey finish," or of putty gauged with plaster-of-Paris. In any case the description "render, float and set" would be further qualified by describing the setting coat.

27. A cistern is required to hold 1,000 gallons; what should be its length, breadth and height, and of what material should it be constructed if used for storing drinking water? What would be the weight of the water in the cistern when full?

(25)

A cubic foot of water contains $6\frac{1}{4}$ gallons, therefore the cubic contents of the tank should be $= \frac{1000 \times 4}{25} = 160$ cub. ft.

The dimensions of the tank may be 10 ft. by 4 ft. by 4 ft. A gallon of water weighs 10 lbs.; weight of water when full $10 \times 1,000 = 10,000$ lbs. = 4 tons 9 cwts. 1 qr. 4 lbs. If the water is a soft water it should not be stored in lead because soft water acts chemically upon lead, and certainly rainwater

stored in a lead cistern should not be used for drinking. The zinc from a galvanized tank is also dissolved by most waters, and though zinc is less deleterious than lead it is not good. Spring water as a rule does not act chemically upon lead, and a hard water also does not act upon it. It is said that an alloy of lead and tin is safe with soft boggy water. Oxide of iron is not dangerous to health, but a noticeable quantity is not pleasant to the taste and is not good. A painted iron tank after the oil of the paint has hardened is safe. A concrete tank, too, is safe.

*28. The diagram shows a block of stone being lifted by a sling chain and dogs; with a pull of 5 cwts. in the crane chain show graphically what the stress will be in each part of the sling chain surrounding the letter A, assuming free play at the eye of the dogs.

(30)

See criticism on next page. See diagram also. If it is attempted to draw a diagram of stresses, using the directions FE and GH we shall be led into absurdity. In our diagram it is seen that CD and BD are not parallel to FE and GH, as they should be if the original drawing were correct.

29. An internal brick wall 12 ft. long has to be removed and replaced by a fir beam which has to carry a distributed load of 4 tons. Calculate the scantling of the beam. If the same load, instead of being distributed, were concentrated at a point 4 ft. from one end, would you consider the beam strong enough? Give your reasons fully.

(40)

See criticism on next page.

Take 12 ft. as the span. Assume the breadth of the beam to be 8 ins. (to take the place of a 9 in. wall, allowing $\frac{1}{2}$ in. each side for furring). Moment of resistance = bending moment at centre $= 1 \times 6 \times 2240 = 13440$ ft.-lbs.

$= \frac{pbd^2}{6}$, where p = safe load in lbs. per square

foot, b = breadth ($\frac{3}{8}$), and d = required depth (in feet). Breaking load (taking Rivington's average), say, 6,500 lbs. per sq. in. = 936,000 lbs. per sq. ft. Factor of safety, say, $\frac{1}{3}$ $\therefore p = 117000$. $13440 = \frac{117000 \times \frac{3}{8} \times d^2}{6} \therefore d^2 =$

$\frac{18 \times 13440}{234000} = \frac{1344}{1300} = 1.033$. $d =$ say 12 ins.

Scantling of beam 12 ins. \times 8 ins. Suppose 4 tons placed 4 ft. from one end, bending moment $= \frac{32 \text{ ft.} \times 2240}{3} = 23893 \text{ ft.-}$

lbs. This is more than 13440, therefore the beam is not strong enough. Some students may more readily understand the following method:—Assuming span 12 ft., constant for centre load $3\frac{1}{2}$ (cwts.), factor of safety $\frac{1}{3}$, breadth of beam 8 ins. (Breadth and depth

in this case in inches.) $80 = 3\frac{1}{2} \times \frac{d^2 \times b}{12} \times 8$
 $= 80 = \frac{56d^2}{96} \therefore d^2 = \frac{7680}{56} = 137.14 \therefore d =$
 11.7 ins.

For the second part, $\frac{ws}{8}$ should be $= \frac{w4 \times 8}{12}$.

$ws = 120$. $\frac{w4 \times 8}{12} = 213.33$, so that the beam is not strong enough. The load should not exceed $\frac{120 \times 12}{8 \times 4} = 45$ cwts. = 2 tons 5 cwts.

[Note.—The student may have in his mind a stock question—how to take the strongest beam out of a round log where he gets a proportion of breadth to depth, but he should not forget that with a given quantity of timber per foot run the beam is the stiffer the narrower and deeper it is made, except that it must not be made so narrow that it will twist or fold.]

30. Draw to a scale of $\frac{1}{8}$ (1 $\frac{1}{2}$ ins. to a foot) a section through two consecutive spandrel steps with moulded nosings of a hanging stone staircase, and describe clearly how such a staircase is constructed.

(35)

See drawing. These steps are built up one upon the other. The bottom step should be on a firm foundation. The inner ends of the steps are built into the wall (6 ins. to 9 ins.), thus having a direct solid support to that end; this also serves to prevent the step from twisting by any weight from the step above resting on its back edge. The rebating of the steps assists in preventing

any settling down of the outer ends. The whole of the steps should be well supported during fixing, and until the masonry or brickwork in the walls is sufficiently set.

*31. The diagram is an outline plan of a first-floor room which is to have a single-joisted floor; state the number, lengths and scantlings of the timbers which you would require for the plates and joists—including trimmers—for this floor.

(30)

No. 14 bridging joists 16 ft. by gins. by 3 ins.; No. 7 bridging joists 12 ft. by gins. by 3 ins. (might be gins. by 2 ins.); No. 2 trimming joists 16 ft. by gins. by 4 ins.; No. 1 trimmer joist 9 ft. by gins. by 4 ins.; No. 1 trimmer joist 13 ft. by gins. by 2 ins. to frame in at the ends of hearth and breast.

In getting out the above quantities a flue has been assumed at each side of the fireplace. In ordinary circumstances we should not recommend a continuous wall-plate. Where it is desirable to use a plate it may be put in in short lengths, as shown by the accompanying sketch. This allows for each alternate space between the joists being solid brickwork, so that in case of shrinkage or rot the wall is not weakened to anything like the same extent as in the case of a continuous plate.

32. Explain clearly the various ways in which the water seal of traps of sinks and w.c.'s is lowered and rendered ineffective, and state what precautions you would take to prevent this; illustrate answer by sketches.

(35)

B

(a) By evaporation when the water closet or sink has been disused for a considerable length of time; (b) by what is called syphonage, that is, the formation of a partial vacuum in the soil-pipe by the rush of the flushing water, &c. Syphonage proper is mitigated by what is called an anti-syphonage pipe, shown on sketch A.

[Note.—The above is probably a sufficient answer to this question, but there is more in the trouble than syphonage accounts for, and it may be of use to refer to it, because, notwithstanding the great variety of wash-down water-closets, there is in this particular respect, perhaps, some room for improvement. The effect of syphonage in unsealing may be produced, and is always to some extent produced, apart from reduced air-pressure in the soil-pipe. The whole mass of water passing through the trap is given a velocity—it acquires an energy of motion—which carries the mass through, so that if the ceasing of the flushing supply is abrupt there may be no seal, even where there is not syphonage. This is provided for in good closets by the “after-flush.” Where a number of water-closets discharge into a common soil-pipe there may on occasions be an accumulation of solid matter forming a plug which, in its downward course, aggravates the ordinary action of syphonage in the closets where no flushing is taking place. There is great objection to the multiplication of pipes, and it will be found that with proper attention to have the soil-pipe sufficiently large and thoroughly ventilated above, to have the connection between the w.c. outlet and the soil-pipe wide and roomy, as shown on the rough sketch B—and probably with less of a “frontal attack”—so that the flush will not enter as a jet, but will adhere to the sides of the outlet and soil pipe, there will be little, if any, need for anti-syphonage pipes.]

Some Comments.

The following are some comments on the foregoing questions:—

21. The tracing example gives too much work for a compulsory question, and handicaps artisan candidates.

22. This is a fair question, but takes too much time to answer fully.

23. A fair question. It suggests that in very many cases the trouble from damp is very imperfectly understood. Where the site of a house is damp, which is the case

with most country houses, the trouble with moisture inside the building is largely due to “condensation.” The still air under the boards of a ground floor is in a “saturated” condition, always ready to give moisture to any surface at a lower temperature. In most cases money would be well spent in shutting out the moisture of the site by a sufficient sheet of concrete; if this is done there will be no danger from dry-rot and very little trouble from damp.

24. A fair question.

25. Too much work in this question.

26. An easy question to a man who knows it.

27. A fair question.

28. The drawing for this question is wrong and misleading. On the assumption, viz., “free play at the eye of the dogs,” a line joining the points E and F should bisect the angle. As shown on the drawing, there would actually be a thrust, instead of the pull of $2\frac{1}{2}$ cwt. which the assumption of “smooth” eyes in the dogs gives. We take the tension in the sling to be the same at D as for the other parts, an assumption which is of course not quite true, but reasonable for the purposes of the question. The sketch does not in any particular show that it was drawn from an actual example.

29. This question is ambiguous. If it is, as it appears to be, to decide upon the scantling of a wooden beam which is to span an opening of 12ft. and carry the loads mentioned safely, why is there mention made of an internal brick wall to be removed? Is it supposed that the load now borne by the foundations of the internal brick wall can safely be added to the load already carried by the outside walls, or is the opening to be less than 12ft.? But then the question says the wall is to be removed; this means the whole of the wall, and on this assumption we deal with it. If the wall to be removed is the lower part of a wall which rises to higher storeys, the load is not a uniformly distributed load. A uniformly distributed load is one which is like water over the bottom of a tank; the load does not help itself by any kind of arch action. We take it that “distributed load” means “uniformly distributed,” otherwise the question is nonsense as it stands. If the rôles of examiner and examinee were reversed, full marks could not fairly be given for this question.

30. This is a fair question.

31. A fair question.

32. A fair question.

Generally the paper is open to portion of our criticism of Stage I. It is not fairly apportioned among the trades. Building construction as a subject is not easy to define, but it is roughly taken to have to do with structures which are not to be moved about—retaining walls, bridges and houses mainly—and it is expected that the student of “Building Construction” shall be trained to enable him to act as a foreman, as a clerk of works, as a draughtsman, or higher office (we are afraid to say architect), and surely such men should know something of door and window fastenings, of mantels, grates and ranges, and of a very great number of other matters which do not appear to be dealt with in these papers.

A Secondary School for 200 Girls at Twickenham, together with a technical institute and pupil teachers' centre, is proposed to be built jointly by the Twickenham Urban District Council and the Middlesex County Council.

A new Colony of Workmen's Dwellings has been provided by the Ecclesiastical Commissioners in and about Mellow Street, Walworth Road, London, S.E. Cottages, flats and tenements are included in the scheme, the total cost of which (including acquisition of site) will be £200,000.

NOTES ON COMPETITIONS.

Southwark Library.

The award has been made in the competition for the proposed public library, Old Kent Road, and on the whole the result is most satisfactory. Unfortunately there are many who were debarred from competing through the uncertainty which existed, until after designs had been sent in, that a qualified assessor was to be appointed. These may take consolation that it was largely owing to their efforts that the promoters were brought ultimately to a reasonable view of affairs, and that they have assisted in saving a goodly number of rather imprudent brethren from a fate which might have been as undesirable as—one hesitates to say it—it would have been deserved. Promoters and competitors were both fortunate in having the services of Mr. A. W. S. Cross, who has made his selection in his usual conscientious manner, and has again issued with his award a list of critical remarks upon the designs. The three pre-miated designs are placed as follows:—First, design No. 46, Mr. Claude Batley, A.R.I.B.A., Kettering; second, design No. 60, Messrs. S. W. Grant & Bowden, 63, Moorgate Street, London, E.C.; third, design No. 8, Messrs. Springhall & Taylor, Manchester. Ninety-nine designs were sent in. Eight of these were disqualified through non-compliance with one of the conditions. These were Nos. 3, 21, 23, 31, 41 B, 64, 80 (scheme 2) and 92.

Convalescent and Nursing Home, Glossop.

It is satisfactory to learn that, so far, the efforts which have been made to obtain an assessor and a revision of the conditions have been successful. The town clerk has informed all applicants for conditions that it is intended to revise them and to extend the time for sending in designs.

Coopers' Company's School, Bow.

Mr. W. D. Caröe, the assessor in the competition for the rebuilding of the Coopers' Company's School at Bow, and the conversion of it into a secondary school, has awarded the first premium (£150) to Messrs. T. Phillips Figgis & C. G. Mumby; the second premium (£150) to Mr. George Elkington; and the third premium (£50) to Mr. H. O. Cresswell—all of London. The cost of the work is put at £32,000. There will be no public exhibition of designs.

The Peace Palace.

A very complete series of reproductions of the designs for the Peace Palace at the Hague submitted by Mr. John Belcher, Mr. A. W. S. Cross, Messrs. James Gibson and William Walcot, Mr. Henry T. Hare and Mr. Alexander Koch is given in Part 7 of “British Competitions,” published from 58, Theobald's Road, W.C., price 3s., an advance proof of which issue has been sent to us by the publisher. This competition was open to all the world, but twenty architects of different nations were specially invited to compete, being paid 4,000 guilders (£320) each. In all, there were 217 competitors. The awards were noted in these columns three weeks ago.

Perth Guildhall.

In the competition for a new guildhall to be erected at Perth the assessor (Mr. James Miller, F.R.I.B.A., of Glasgow) recommended that the design marked “Civis” be adopted, and at last week's meeting of the Perth Guildry Incorporation this was agreed to. The author is Mr. A. G. Heiton, architect, of Perth. The new hall is in seventeenth-century style, adapted to modern requirements, and will be erected on the old site. The cost is estimated at about £2,250.

Competitions Open.

The following is a list of competitions open:—

DATE OF DELIVERY.	COMPETITION.
June 26	NURSING AND CONVALESCENT HOME AT GLOSSOP, to cost £6,000. Premiums of £20 and £10. Particulars from Mr. T. W. Ellison, town clerk, Norfolk Chambers, Glossop.
.. 30	ELEMENTARY SCHOOL AT EAST WEMYSS. Particulars from Mr. A. Watson Taylor, clerk to the School Board, East Wemyss, R.S.O., Fifeshire.
July 2	SECONDARY SCHOOL FOR GIRLS AT AIGBURTH VALE, for the City of Liverpool Education Committee. Limited to architects in Lancashire and Cheshire. Particulars from the Town Clerk, Municipal Offices, Liverpool.
.. 4	SCHEME OF SEWERAGE AND SEWAGE DISPOSAL WORKS AT WARBLINGTON. Premiums of £100 and £50. Particulars from Mr. J. W. Loader Cooper, clerk to the U.D.C., Queen Street, Emsworth.
Oct. 1	ALPHABET COMPETITION. Prizes of £20, £10 and £5. For particulars see "Architectural Review."
.. 31	BOURSE AT CAIRO. — Premiums of £250 and £100. International competition. Designs to be submitted to the "Corporation des Agents de Change," Cairo, Egypt.
Date not yet decided upon.	NEW MUNICIPAL BUILDINGS AT STIRLING (to cost £12,000). Premiums of £100. Particulars from Town Clerk, Borough Buildings, King Street, Stirling.
No date	DETACHED AND SEMI-DETACHED HOUSES AT CLIFTONVILLE, BELFAST. — Premiums £700. Particulars from R. J. McConnell & Co., 51, Royal Avenue, Belfast.
..	SCHEME OF DECORATION for the interior of Cambridge Hall at Southport. Premium £5 5s. Particulars from Mr. J. Ernest Jarratt, town clerk, Town Hall, Southport.

Obituary.

Mr. E. E. Scrivener, of the firm of Messrs. R. Scrivener & Sons, architects, Shelton, died recently.

The late Mr. J. T. Smith, civil engineer, of Stratford-on-Avon, who died on March 31st, left estate which has been valued at £120,728 gross.

Views and Reviews.

Kelly's Building Trades Directory.

A fresh edition of this invaluable publication has just been issued. It is to be regretted that the demand does not allow its publication more frequently than at intervals of four years. We have received enquiries which show that many persons do not know even that it is published, or else have forgotten the fact. It deserves to be in every office of any importance. It will be found most useful for reference purposes when the names of specialists in any district are required by architects or contractors, as so frequently happens. There is no other reference book which gives anything like the same kind of information. Not only are the trades classified under towns and counties, but also as regards London, the country, and Ireland, the Channel Islands and the Isle of Man. There are also indices which materially aid quick reference. The present is the tenth edition of this directory, the first having been issued in 1870. It numbers nearly 3,000 pages.

"Kelly's Directory of the Building Trades," Tenth Edition, 1906. London: Kelly's Directories, Ltd., 182, 183, and 184, High Holborn, W.C., price 30s.

Notes and News.

Architectural Association of Ireland.—Mr. J. Holloway has been elected president for the current session.

Childwall Parish Church has been restored under the direction of Mr. J. Francis Doyle, F.R.I.B.A., of Liverpool.

The new **Royal Hotel at Brighton** has just been completed in Queen's Road. The architects were Messrs. Clayton & Black, of Brighton.

A new **Exchange at Cardiff**, independent of the Mount Stuart Square institution, is to be built. Mr. E. W. M. Corbett, A.R.I.B.A., of Cardiff, is the architect.

New Baths and Washhouses at Sunderland were opened last week. They are situated in Hendon Road and have been erected from designs by the borough engineer, Mr. J. W. Moncur.

Messrs. Patman & Fotheringham, Ltd., of 100 and 102, Theobald's Road, London, W.C., have secured the contract for new motor houses, &c., at Hendon, for Messrs. Schweppes, Ltd.

Simplex Conduits, Ltd.—The business hitherto carried on by the Simplex Steel Conduit Co., Ltd., is now continued under the name of Simplex Conduits, Ltd. The addresses of the head and branch offices remain as before—the London office being 20, Bucklersbury, E.C.

Messrs. R. Waygood & Co., Ltd., have erected five lifts at the Hearts of Oak Benefit Society's new building in Euston Road, two for passenger service (to raise five persons at 175ft. per minute, with handle control in the cage), two electric book lifts, and one electric service lift to raise 1½ cwt at 120ft. per minute.

A **Course of Six Lectures on Domed Buildings** has been given by Prof. Beresford Pite at the London County Council School of Building, Ferndale Road, Brixton. The concluding lecture, dealing with the domes of the Invalides and the Pantheon at Paris, is to be given next Thursday, at 8 p.m. It is open to all students.

The new **Lock at Molesey** was opened for traffic on Saturday. With the exception of Teddington it is the largest lock on the Thames, being 267ft. long and 30ft. wide—about 90ft. longer and 11ft. wider than the old lock that it replaces. The total cost of the work has been about £14,000. The narrow part of the cut above the lock is being widened and deepened for a distance of 280ft.

A **Dundee School.**—Dundee ratepayers are complaining about the great extra cost of building a new school in their town. The School Board's architect was commissioned to prepare plans for a structure to cost £15,000; but now that tenders have been accepted the total amount is £21,918, which, with furnishing and extras, will, it is estimated, bring the total cost probably up to £25,000.

Magistrate's Criticism of a new London Police Court.—The new police-court in Old Street, London, which has taken the place of the Worship Street Court, was opened last week. Mr. Cluer, the magistrate, complained of the noise from outside, also that the space which should have been devoted to the court accommodation had been wasted on a large hall and an elaborate staircase. Public money and space alike had been wasted, and the accommodation given was wholly inadequate.

ENTRANCE TO A COUNTRY VICARAGE
NEAR RYANWELL, ESSEX. S.A.T.V.F.S.

TESTS WITH FIREGRATES.

A VERY interesting and valuable series of tests with domestic firegrates has been conducted at the new Government offices in Whitehall by the Coal Smoke Abatement Society (represented by Dr. H. A. Des Vœux and Mr. W. H. Atkin Berry, F.R.I.B.A.) in conjunction with Sir Henry Tanner, chief architect to H.M. Government.

The objects of the tests were fourfold, namely, to ascertain (1) the amount of smoke given off, (2) heating power, (3) economy of fuel, and (4) suitability for office and household purposes.

In response to invitations to manufacturers, between forty and fifty grates were submitted. Of these, twenty-four were first selected after preliminary inspection and the elimination of such as were judged unsuitable.

The First Test.

The twenty-four grates were fixed in separate rooms on the mezzanine floor of the building, around an open square court, each room being about 4,000 cub. ft. in size and having one window (which was kept closed) and one door (also kept closed, except for ordinary purposes of ingress and egress); the chimney flues, too, were all of the same height and size, namely, 68ft. high and 11ins. diameter. The walls of the rooms were of brick left rough and unplastered, and the floors and ceilings of rough concrete, no floorboards being laid down. There was no furniture in the rooms.

The tests were conducted on four consecutive days.

The fires were lighted every morning at 8 o'clock and regulated throughout the day with the object of securing and maintaining a temperature of 60 degs. Fahr. in the room, or as near that as possible, the temperature being recorded every half-hour by three thermometers, one in the corridor outside the rooms and two in each of the rooms.

The amount of coal and wood consumed was carefully weighed and recorded, as well as the times of stoking. On the roof of the building special shelters were erected as posts for watchers of the twenty-four chimneys, each of which was numbered. The numbers, however, were unknown to the attendants in the rooms below, nor were any makers of grates, or representatives of makers, permitted to attend the tests. Every five minutes the watchers on the roof recorded on charts the amount of smoke emitted, using a series of shades designed by the late Mr. Bryan Donkin.

At 4 p.m., after eight hours, the fires were drawn, the cinders weighed, and the weight subtracted from the amount of coal put on the fire; the wood used was also weighed and half its weight added to the amount of coal, thus giving the total quantity of fuel actually consumed.

The results of the tests are given in Table I.

The Second Test.

Upon these results the examiners selected three grates out of the twenty-four for further test—namely, those of Messrs. Candy & Co., J. & R. Corker, Ltd., and the London Warming and Ventilating Co.; but prior to this further test with these three grates, tests were made with twelve other grates out of the remainder of those originally submitted, these twelve grates being fixed and tested under exactly similar conditions as the twenty-four. The results of this second series of tests are given in Table II.

The Final Test.

From the twelve grates tested together the examiners selected three for final test—namely, those of Messrs. Hendry & Pattisson, the Teale Fireplace Co., and Smith & Wellstood. As, however, the last-named grate was identical with that of the London Warming and Ventilating Co. it was omitted from the final selection. In the third and final test, therefore, there were five grates—namely,

those of Messrs. Candy & Co., J. & R. Corker, Ltd., Hendry & Pattisson, the London Warming and Ventilating Co., and the Teale Fireplace Co. This final test was conducted in exactly the same way as the others, and in addition a test for carbon dioxide was made with the object of ascertaining the efficiency of each grate as a coal-burning machine for producing heat. The results of the final test are given in Table III.

Heat Efficiency.

The test for thermal efficiency of firegrates showed that less than 7 per cent. of the total heat of the coal was utilized for warming the air of the rooms; with steam boilers from 70 to 75 per cent. of the calorific value of the coal is transferred to the water; so that the efficiency of steam boilers is more than ten times that of domestic firegrates. In his report on this portion of the tests Dr. J. S. Owens, A.M.I.C.E., says :—

"Considering the two best grates, the quantity of heat given to the walls, chiefly by radiation, is very great, amounting to over 79 per cent. in one case and 76 per cent. in the other; but it must not be thought that this is all lost heat. It is well known that we feel warm in a room with warm walls in which the air is cold, but we feel cold in a room with cold walls in which the air may be warm. This is largely because

air is such a bad conductor of heat and because we are very sensitive to radiant heat . . . Mr. Ackermann carried out some very complete tests of a hot-water warming plant at a large London hospital, the results of which showed that 22 per cent. of the heat discharged from the radiators was utilized in warming the air of the room, while the remaining 78 per cent. was radiated into the walls and through the windows. Thus it will be seen that the percentage of heat taken by the walls was practically the same for the radiators and open fires, while the efficiency of the radiators in warming the air of the room was about three times as great as that of the open fires. If, however, we consider the efficiency of the hot-water plant, taking into account all heat losses from the furnace to the radiators, the figures become more alike, being 8 per cent. of the heat of the fuel burnt for the hot-water plant, as against 7 per cent. for the open fires. In the apparatus which Mr. Ackermann tested the distance from the source of heat to the radiators was abnormally great, and consequently a very large quantity of heat was lost in transit. In the case of the open fires the chimney losses, 14 to 16 per cent., are about twice as great as compared with the efficiency. In the case of the radiators there are no chimney losses, the rooms being the

"DRAWWELL" GRATE. J. AND R. CORKER, LTD.

equivalent of the chimneys and rooms together in the case of the open fires. If for the two open fires before-mentioned we add the chimney losses to the heat given to the air of the room, we have, say, 21 per cent. and 23 per cent. as the combined efficiency, which compares very well with the 22 per cent. which Mr. Ackermann obtained in the case of radiators."

THE "DEVON" FIRE. CANDY AND CO., LTD.

radiate the heat most effectually towards the centre of the room, for which purpose the hearth is raised to the level of the fire. Lower portion of fireplace has solid bottom on which fire burns, there being no metal grid or air-chamber beneath.

J. & R. Corker, Ltd.—"Drawwell" grate. Fitted with adjustable canopy, semicircular and solid brick back, with solid brick back in front sloping inwards, the bottom forming a basin with loose grate to lift out. Ventilating fret with pan attached.

London Warming and Ventilating Co., Ltd.—"Florence" grate. Self-contained auxiliary flue controlled by damper connected to adjustable canopy. When canopy closed and back flue brought into use, smoke drawn through fire to a point where heat is practically incandescent, and so appreciably consumed. Automatic shaking bars, mounted on square shaft and made abnormally deep in the body to heat ascending air-currents as weight of coal varies in different bars; bars intended to rock and clear fire of ashes and dust, thus allowing continuous current of heated air to pass and keep fire burning brightly.

Teale Fireplace Co., Ltd.—B. Teale "Economizer Popular Type." Firebrick back in four parts enclosed in double sheet steel casing forming air-chamber, air being drawn from outside and discharged through grating above. Warm-air outlet controlled by louver.

Hendry & Pattison, Ltd.—D. O. Boyd's "Hygiastic" warm-air grate. Fresh air from outside enters under hearth, circulates round back of grate, is warmed, and passes into room through grating above. Fireclay lumps sloped to assist radiation, and so built up as

Canopy closed and Back Flue open.

Canopy open and Back Flue closed.

Law Cases.

Dispute about South Shields Municipal Buildings.—In the Chancery Division of the High Court of Justice recently the case of *Neill and others v. The Corporation of South Shields* was heard. Counsel for the plaintiffs moved for an order that the defendants might be restrained, until judgment, from acting upon a notice of March 29th last, while counsel for the defendants had a cross-motion that proceedings might be stayed under an arbitration clause. The facts of the case were as follows:—The plaintiffs, a large firm of builders and contractors at Manchester, some time ago entered into a contract with the defendants for the erection of new municipal buildings at South Shields. The arbitrator under the contract was the architect, Mr. E. E. Fetch, A.R.I.B.A., of London. Unfortunately there had been constant friction from the commencement between the plaintiffs and the architect. Up to the present time work to the extent of about £10,000 had been completed and the architect's certificate given. Under the specification the plaintiffs were bound to put in mortar of a certain kind. They said they had done that, and that the mortar had from time to time been passed by the architect. The latter, however, had ordered the plaintiffs to remove the whole of the mortar and concrete, which could not be done without pulling the building down. The notice said this was to be done at the cost of the plaintiffs, who were to substitute therefor mortar and concrete "in accordance with the specification." That was the notice the plaintiffs sought to restrain the defendants from acting on. The plaintiffs asked for arbitration as well as the defendants.—Mr. Buckmaster, K.C., for the defendants, said that so far as the question in dispute involved whether this mortar was right or wrong, that was a matter in the discretion of the architect.—Mr. Justice Buckley: "Supposing that for one month he has passed the material, and it has been put in the building, and then he turns round and says, 'This mortar is all wrong; pull the building down?'"—Mr. Buckmaster said that under the contract the parties had agreed that the architect should be the final judge of the matter.—Mr. Justice Buckley: "If he acted reasonably."—Mr. Buckmaster admitted that the architect's capacity as a judge could be questioned, but he failed to see on what ground the exercise of his authority could be questioned.—Mr. Justice Buckley: "If the contractor uses what the architect directs, do you say he must do the work again at his own costs?"—Mr. Buckmaster said he did not intend to give up whatever rights the defendants might have in the arbitration.—Mr. Justice Buckley suggested that the proper course would be to make the costs of the motions costs in the action, and let the case go for trial without prejudice to any application either party might make to refer any of the questions to arbitration.—It was agreed that proceedings should be delivered as soon as possible, and leave to apply to advance the trial was given.

St. John's Church, Sleekburn (Northumberland), was dedicated recently by the Bishop of Newcastle. It has been erected from designs by the diocesan architect, Mr. Arthur B. Plummer, F.R.I.B.A., of Newcastle, the contractor being Mr. J. Goulding, of Blyth.

Lincoln Brick Co., Ltd.—The annual report states that the balance to the credit of profit and loss, including £2,726 brought forward, is £8,207. The directors propose a further dividend of $\frac{4}{5}$ per cent., making 7 per cent. for the year, writing off £1,000 from the plant and machinery account (which now stands at £55,000), and, after paying directors' fees, to carry £3,111 forward.

BOYD'S "HYGIASTIC" WARM-AIR GRATE. HENDRY AND PATTISSON, LIMITED.

not to crack through unequal expansion or intense heat; cased in riveted steel back, carried up and finished round flue so as to simplify and lessen cost of fixing. Regulating valves for smoke and air, and box ashpans under fire. Bars slope inwards to deflect air into fuel and prevent cinders and coal dropping out.

OUR PLATES.

Llanwit, Farnborough, Hants.

THE illustrations given as centre plates in this issue are from two water-colour drawings by Mr. Briant A. Poulter of a house called "Llanwit" at Farnborough, Hants, for Captain H. Iltid Nicholl. The main feature of the site is its rapid slope towards the south-east. The plans on the view of the entrance front fully explain the accommodation. The hall is carried up two floors with a gallery. The sloping nature of the site has been utilized for the planning of two sitting-rooms beneath the level of the main floor, and opening by French doors directly into the garden. Internally all the walls are finished in white plaster, and the woodwork painted very dark brown. The fireplaces, specially designed by the architects, are of Caen stone and local tiles, with Messrs. Bratt, Colbran & Co.'s "Heaped" fires. Externally the walls are of whitewashed brick with Portland stone and courses of old tiles sparingly used. The roofs are covered with old local tiles. The building was erected under the architects' personal supervision by Mr. Thomas King, builder, of Camberley, Surrey, who carried out the whole of the work, except the iron casements and leadlights, which are by Mr. J. A. Girdler, of Reading. The architects are Messrs. H. R. & B. A. Poulter, of Camberley.

RECONSTRUCTION OF GLASGOW CENTRAL STATION.

THE work of reconstructing the Glasgow Central Station of the Caledonian Railway Co., which has been in progress for five years, has now been completed. The outstanding engineering features of the scheme are the removal of the wall which supported the roof on the west side of the old station, and the substitution of steel columns, the reconstruction of Argyle Street Bridge, the building of the new bridge over the Clyde, the raising of the old bridge by about 2ft. 6ins., and the dismantling of Bridge Street Station. Over the new bridge which spans the river nine lines of rails are laid, making, with the four on the old bridge, thirteen bearing traffic to and from the terminus. The new bridge differs from the old one in this particular that the trains run on the tops of the girders instead of on the bottom, thus facilitating the use of all the available space for rails with no projecting girders above. The roof of the new section of the station is nearly 1,000ft. long. It consists of an elliptical-arched girder structure. Bridge Street Station has been dispensed with. In the old Central Station the aggregate length of the nine platforms was about 4,500ft.; in the extended station, with its thirteen platforms, the aggregate length is 8,880ft. With the exception of one or two, the old station platforms were only about 13ft. wide, whereas the minimum width in the new station is about 23ft. Commodious arrangements have been made for parcels traffic, and the luggage and other offices have been increased in size proportionately. There are now four entrances to the station, one each from Gordon Street, Argyle Street, Union Street and Hope Street.

"LLANWIT," FARNBOROUGH, HANTS.

Enquiries Answered.

Questions should in all cases be addressed to the Editor and be written on one side of the paper only. The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters. Correspondents are particularly requested to be as brief as possible. The querist's name and address must always be given, not necessarily for publication.

Valleys in Slating without Lead.

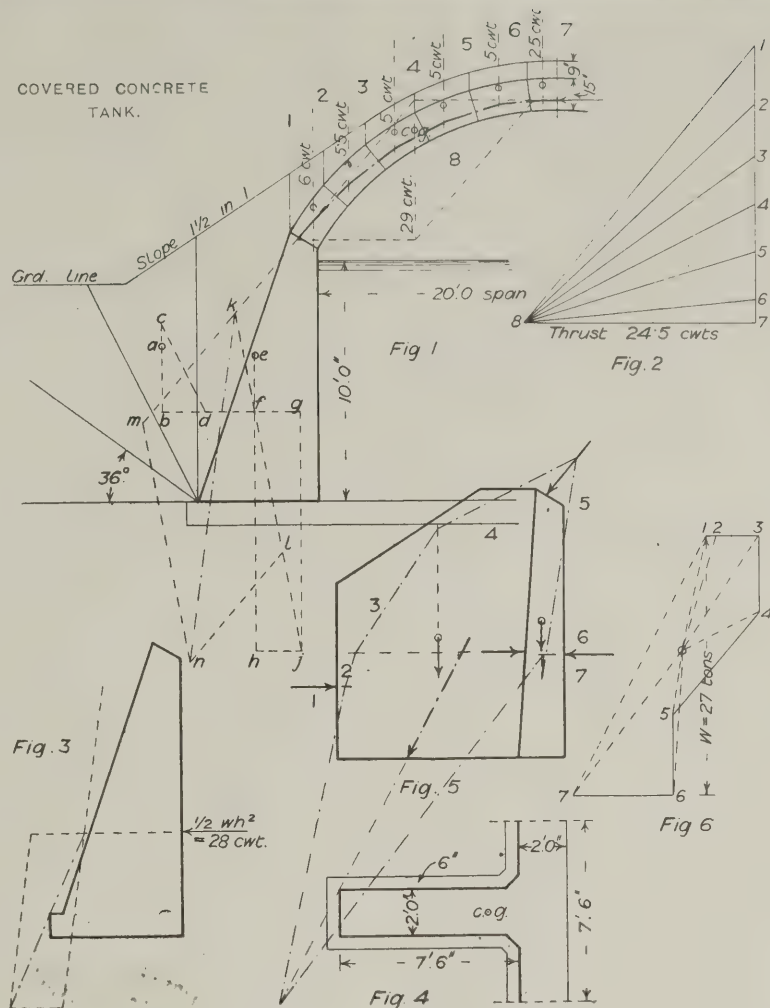

NORTH WALES.—GWYNEDD writes: "In our issue for May 16th you published a most interesting article on the traditional methods of tiling. Can the writer tell me how to do valleys in slating without lead? At present I either do a secret gutter or have bakers, and so no lead is seen, but I notice in the drawings of Mr. Guy Dawber's work that the slating seems to be carried round the valley without a break. How do the battens stand bending so much—or is it on boarding? In the old work about here they avoided gulleys whenever possible, but, when used, they laid a straight course of slates down the gutter first, as we now put lead, and made good the joint in hair mortar inside. But this is not a very watertight job. Has anyone tried a slate gutter made like the tiling one shown in your issue for May 16th?"

Near Collyweston I have often seen slate gutters laid on the lines of the old style tile-alley, but although it looks well this method does not appear to me to be so logical a treatment for slating as the other and more usual one of the Cotswold district. Slates in any case are cut, and it is but little easier to cut them square than to any other shape. For this reason I think that the old method still occasionally practised in Northamptonshire, Gloucestershire, and probably wherever else stone-slating is usual, is the right one; and this, I take it, is what you refer to in Mr. Dawber's work. It would certainly be difficult to accommodate battens to the compound curve of such a valley, and I believe the readiest method is to board the valley and nail thereon curved firrings (spaced as the battens), upon which the slates are laid, these being cut as shown by the sketch below. Alternately the firring could

be done first and the slates nailed to boarding as you suggest. I have seen some old roofs in which the valley was filled out to the necessary curve, apparently with lime and hair mortar, upon which stone slating was bedded direct. It is a terrible job to get these things done, unless by an imported country workman who has been used to such methods. A fine London example of a Westmorland slate roof with the valleys worked round is Mr. Wade's new Royal School of Art Needlework, next to the Imperial Institute at South Kensington.

E. G.

Design for Covered Concrete Septic Tank.

CARLIOL writes: "I send rough sketch of a septic tank to be built of concrete, and should be glad if you would show me the graphic method of working out the thickness of the walls. The thickness of the arch I have taken from Trautwine's formula

$$\sqrt{\frac{\text{Rad} + \text{half span}}{4}} + 0.2 \text{ ft.}$$

Would the following method be correct for all practical purposes?—(1) Find the thrust of the arch at the springing line by obtaining the centre of gravity of half arch and the load it sustains, taking this as being kept in equilibrium by the horizontal thrust at the crown acting at one-third height from the soffit, and the thrust at the springing line acting at one-third depth from the extrados. Having the direction of three forces and the amount of one, the triangle could be solved. (2) Combine the thrust thus found with the thrust of the earth backing and the weight of the wall. (Conditions when tank empty.) (3) Combine the thrust of the arch with the combined thrust of the earth and water, together with the weight of the wall. Please also show the method of introducing buttresses, not only their dimensions, but the mode of determining the distance apart."

Fig. 1 shows the design submitted for covered concrete tank. The thrust line of the arch which is added has been obtained in the usual way by the parallelogram shown and the reciprocal diagram, Fig. 2. The combined weight of wall and thrust of earth when the tank is empty is also shown on Fig. 1, the lettering representing the order of working. Fig. 3 shows the alteration produced in the resultant when the tank is full of water, and as the resultant comes outside the wall the thickness will probably require to be 6 ft. at the base instead of 5 ft. Fig. 4 shows the plan at base of a proposed modi-

fication, the wall being made thinner and buttresses added at intervals of 7 ft. 6 ins. The section of buttressed wall being as Fig. 5, all the weights and thrusts must be found and marked as shown by thick arrows; then, treating them as a series of independent forces of which the resultant is required in amount and position, draw the force polygon, Fig. 6, and the closing line 7—1 will be the value and direction of the resultant. To find the position of the resultant, select a pole, draw vectors, and parallel to these draw the funicular polygon across Fig. 5; then the position of the resultant is given by the stroke-and-dot arrow drawn parallel to 7—1 through the intersection of the funicular polygon lines across spaces 7 and 1. To find the maximum pressure on the base, the section modulus must be obtained as for a tee-iron, in this case

$$\frac{2 \times 6.2^3 + 7.5 \times 3.3^3 - (7.5 - 2)(3.3 - 2)^3}{\frac{3(6.2)}{476.6 + 269.0 - 12.0} - 18.6} = 39.4$$

Then $\frac{W}{A} \pm \frac{M}{Z} = \frac{27}{30} + \frac{27 \times 3.3}{39.4} = 9 + 2.3 = 11.3$ tons per sq. ft. compression at the point of the buttress and 1.4 tons per sq. ft. tension at the inner edge of the wall.

HENRY ADAMS.

Churches to Measure near Bury St. Edmunds.

BURY ST. EDMUNDS.—B. P. writes: "What churches are worth measuring within easy walking or cycling distance of Bury St. Edmunds, together with their styles?"

At Bury St. Edmunds itself there are two Perpendicular churches of St. Mary and St. James. The latter has a chancel in the Decorated style by Sir Gilbert Scott, built in 1868. The old Abbey gates are Decorated in style. The old Norman tower, the remains of the monastery and abbot's bridge, built

by Robert de Gravel, who died in 1221, are all worth studying. The Abbey is typical of the Franciscan order. Other churches within a few miles of Bury St. Edmunds are the church of Horningsworth, Iksworth, which is chiefly Decorated and partly Perpendicular; Little Laxham, which is Norman and Perpendicular; and Sackford, which is Early English and Decorated. Going further afield there are the churches of St. James, Hadleigh, Lavenham and Stoke-by-Nayland; All Saints', St. Gregory and St. Peter's, Sudbury; and Boxford—all of which are Perpendicular in style. H. Y. M.

Building Estates and Architects.

PERPLEXED writes: "(1) In the conditions of sale usually made for building estates is one 'that the plans, elevations, &c. of any intended building shall be approved by the architect to the vendors.' To what extent can an architect use this power? Can he decline to approve plans the elevations of which are similar to those of adjoining houses on the estate and which are more expensive to erect? (2) A building estate syndicate has wound up and is now in liquidation, and the mortgagees become possessors of certain plots and employ an architect to prepare plans of the plots for purposes of sale, &c. The architect of the (late?) syndicate comes along and says that he is still the architect to the estate and claims the right to approve the plans, &c. of proposed houses, &c. Can he do so?"

(1) The architect to a building owner empowered by conditions of sale to approve of plans and elevations can disapprove entirely or in part with the drawings suggested for any particular plot—but of course he must have reasons for his conduct, and his decision must be a reasonable one. The builder's remedy in case he considers a decision unreasonable is (a) to build the houses notwithstanding—he takes the consequences of an action at law; (b) to apply to the court for a "mandamus" to compel the approval of his plans, but it is much to be preferred that a proper agreement should be come to between the parties. (2) If the mortgagees have acquired the "equity of redemption" and are actually in possession of the estate, I do not think the architect appointed by the former owners can have any "locus standi" in the matter. F. S. I.

Size of Rolled Joist.

LUTON.—SURVEYOR writes: "The accompanying drawing shows part plan and section of a building. Please give method and result of ascertaining the section required for a rolled steel joist for the above opening—(a) if the floor joists are put as shown, (b) if the floor joists bear on front and middle walls. What proportion of attic floor should be considered, and how is the weight of the roof computed in relation to wall?"

If the rolled joist has to carry the wall and share of roof only, the weights will be estimated as follows:—For wall $(14 \times 9 - 3.5 \times 4.75) \times 1.75$ ft. thick $\times 1$ cwt. per ft. cub. = 82 cwt.; for roof $14 \times 12 \times \frac{1}{2} = 84$ cwt.; and $\frac{82 + 84}{20} = 8.3$ tons total load distributed.

The span being 14ft., this will require a

British standard beam (B.S.B. 13) 8ins. by 5ins. by 28 lbs. If the floor joists are placed the other way, so that the rolled joist has to carry the weight of the two floors in addition to above, the extra load will be $14 \times 7.5 \times 1.25 = 131$ cwt. for the first floor; the attic floor, although partly out of use for want of height, will have the weight of partitions instead, so that it may be taken as half the value, and $\frac{131 + 65.5}{20} = \text{say } 10$ tons, making

the total load under the new conditions $8.3 + 10 = 18.3$ tons, which would require a British standard beam (B.S.B. 16) gins. by 7ins. by 58 lbs., or (B.S.B. 18) roins. by 6ins. by 42 lbs., or (B.S.B. 20) 12ins. by 5ins. by 32 lbs., the lighter joists with the greater depths giving about the same strength.

HENRY ADAMS.

Thickness of Walls for Villas.

X. writes: "What is the required thickness of a flank wall to a villa residence built within the Metropolitan area?" (Sketch of three-storey building sent, not reproduced.)

The answer to your question is to be found in the first clause of the first schedule to the London Building Act of 1894, which provides:—Buildings not public and not of the warehouse class. "External walls shall be of not less thickness than . . . (1) When the wall does not exceed 25ft. in height its thickness shall be as follows: If the wall does not exceed 30ft. in length and does not comprise more than two storeys, it should be 8½ins. thick for its whole height. If the wall exceeds 30ft. in length or comprises more than two storeys it shall be 13ins. thick below the topmost storey, and 8½ins. thick for the rest of its height." Yours is a three-storey building, and therefore must be 13ins. thick below the topmost storey. It should be remembered that an apartment in the roof is a "storey" under the Act (definition 5). F. S. I.

Damage to Roof by Gale.

LEAMINGTON SPA.—BREEZY writes: "In March, 1905, I completed the building of a new house with lodges, &c., and in accordance with the terms of contract the final payment was made in September last. In January, during a severe gale of wind, one of the hips of a lodge, which is rather exposed, was partially stripped of tiles. The owner asked me to replace these, which I did, rendering account in due course. The architect now writes that he thinks I ought to waive the claim, although he admits that the damage was entirely due to the effects of the storm. Do you consider I should do as he asks, or am I entitled to be paid?"

SIZE OF ROLLED STEEL JOIST.

There is no legal obligation whatever upon a builder in such circumstances as these. The contract was completed, and the architect satisfied when the final payment was made. It does not appear even now to be alleged that the work was defective (much less fraudulent), and unless the builder wishes to "throw a sprat to catch a herring" I see no reason why he should accede to the architect's request to waive the cost of the recent repairs. F. S. I.

Right of Light.

MIDLAND.—ASSISTANT writes: "A prospective client of mine has a house, of the usual villa type, with windows overlooking the entrance to a field at the rear. It was understood at the time of building that a road would be cut here—the house being in the corner—but the idea has been abandoned, and the strip of land, and that at the rear, let on a fairly long lease. My client, who bought the land and built the house fourteen years ago, has an idea that he has now a right to the light at the side, and has been told by his solicitor and a former architect that such is the case—twelve years now, instead of twenty, constituting his right. I do not for a moment believe that this right could be equitably claimed, as this side-light is supplementary to the usual windows in this class of property, being lighted at back and front as well. Kindly give your opinion on the matter and say whether a shorter limitation has, or will, come into vogue. This would cause universal complication."

The fact that a road was proposed at the time of sale will not help your client, unless he distinctly bought a corner plot, with a covenant or a contract from the vendor that a road would be made in that position. You should procure a copy of the original sale particulars and building covenants, and I have little doubt that all your questions will be answered. I know of no subsequent Act to that of 2 & 3 Will. iv. c. 71 (an Act for shortening the time of prescription in certain cases); this by section 2 shortens the time in the case of an easement to twenty years (practically nineteen years and a day). Every new Act of Parliament causes complications, and unfortunately our legislators do not always recognize the fact. F. S. I.

Rebate on Purchase-money of House.

W. J. P. writes: "A builders offers to sell for a certain sum to a client a villa residence which the builder proposes to erect similar to one adjoining already built by him and sold to client (same parties in each case). In an enclosed letter with offer, builder confidently tells client that the offer is subject to a rebate of a definite sum, upon which client agrees to purchase, and upon completion (two years ago) pays to builder the purchase-money, but does not deduct the rebate, builder promising to remit the amount to client. Builder has not paid the rebate, notwithstanding repeated promises to do so. Has client any legal remedy; if so, how must she proceed?"

This appears to be a matter which can be decided by a solicitor who has access to all the documents, and can enquire fully into the facts of the case. On the correspondence, of which a copy is submitted, it appears that the rebate is recoverable (though you may be penalized for the absence of a stamp on the second letter); but a county-court judge, before whom such a case will go, will certainly ask for a full explanation of the transaction, and will especially enquire into the reasons (1) why the deduction was not made from the purchase-money at the time, (2) why two years have been allowed to elapse before it is claimed. You should consult a solicitor before doing anything.

F. S. I.

Correspondence.

R.I.B.A. Fellowship Elections.

SIR,—Will you kindly allow me to reply through your columns to the numerous inquiries we have received on the question of demanding a poll for the current list of candidates.

We have no desire to recede from the position we have constantly held, and we find that the resentment against these elections exists as strongly as ever, especially, just now, among the Birmingham men. But in view of the great anxiety expressed in the recent speeches at Conduit Street, and of the appearance in this list of the names of men who will be an acquisition to the Institute, we in Leeds have decided, rather than give the slightest ground for the charge of fractiousness which has been so freely made, not to demand a poll on the present occasion.

We have been actuated throughout solely by a desire to maintain the honour of the Institute, and we drew up a courteous memorial expressing our views which was duly presented to the Election Procedure Committee.

We hoped that in common fairness, and following several recent precedents, this memorial would be placed before members in the Journal as publicly as the statements made by the other side. But as it has not been published, nor even acknowledged, we shall be grateful if you will give it the greater publicity of your columns. I may say it was carefully held back to avoid drawing attention from the Council's proposals on registration.—Yours truly,

FREDERICK MUSTO,

Secretary, Leeds Associates' Meeting.

LEEDS.

The following is the memorial referred to:—

TO THE CHAIRMAN AND MEMBERS OF THE
R.I.B.A. COMMITTEE ON ELECTION
PROCEDURE.

GENTLEMEN,—The undersigned Associates, desiring to approach your committee with respect and in due constitutional form, and being denied the opportunity of taking part in its deliberations, venture to place their views before your committee in the present memorial, submitting—

(a) That the reasons which led to the recent demand for a poll and its result have been misunderstood or wrongly stated by members of the committee.

(b) That any attempt to revise the procedure of elections generally which omitted to enquire into the legitimate grounds of complaint would render the position worse than before.

(c) That the decisive nature of the recent voting indicated a strong feeling of dissatisfaction throughout the country, which deserves the fullest recognition and respect of your committee, and should convince them of the necessity for full investigation.

Your memorialists therefore earnestly request the serious attention of your committee to these facts and to the following observations in relations thereto:—

Firstly, as to the reason for the demand for a poll.

It is an undoubted fact that as a consequence of the second resolution passed on February 29th, 1904, candidates of relatively insignificant professional standing have been nominated by the Council and duly elected to the Fellowship. Protests have been made from time to time, both at meetings of the Institute and in the Press, against this interpretation of the resolution, but they have been unavailing, and the recent demands for a poll were avowedly made with the object of calling the attention of the Council in an emphatic and perfectly regular manner to

the dissatisfaction which exists throughout a large proportion of the membership. The voting papers were perfectly clear in their wording, following the form prescribed in the regulations; and the significance of the voting is unmistakable. The statement that your memorialists desire to exclude, without exception, every candidate who shall not have passed the qualifying examination is incorrect and unfounded. But they respectfully submit that exceptions should be made only in the cases of outstanding prominence and recognized professional distinction, and after a searching investigation of which the result should be voted on by a ballot of all members.

In this way the Fellowship of the Institute would become an honourable distinction conferred by the general assent of brother professionals with full opportunity for the exercise of discrimination.

The committee may confidently rely on the discrimination of members in this matter, as they cordially welcome the candidature of men of distinction. In the case of the recent election of leading architects who had attained eminence in the profession it was generally felt that the Institute was honouring itself as well as the candidates.

But it cannot be established that the election of large groups of candidates recommended by the Council on the sole grounds of the practice qualification and the short time remaining before the closing of the door is likely to add dignity to the Institute or to confer any real distinction on the candidates themselves. The nomination of men who have neglected or failed to qualify as Associates, or of those who have practised mainly as engineers and surveyors with very little architectural capacity, has roused the opposition of members who would otherwise have accepted the situation and waited for the new by-law to come into force.

Secondly, as to remedial measures.

The prevailing feeling among members in regard to election to the Fellowship is undoubtedly correctly reflected in the first resolution passed on February 29th, 1894, and adopted on June 6th as a by-law.

Since the institution of the compulsory examinations the number of men who have thereby qualified as Associates has steadily increased. They have been actuated by a spirit of *esprit de corps*, by a desire for honourable membership of the Institute, and by the encouragement of presidents and leaders of the Institute and the provincial societies; they have felt the educational value to themselves, and have not grudged the expenditure of valuable time and the considerable outlay in preparation, in fees and in subscriptions. But they have not expected to find that others of no greater experience and training, and even some who have failed where they themselves had succeeded, were being elected over their heads to the rank of the Fellowship. Your memorialists humbly submit that without some reform in this direction no mere alteration in the details of polling is likely to relieve the present tension.

If it be urged that the elections which are the subject of this memorial have taken place with the due observance of by-laws and regulations and with the tacit consent of your memorialists themselves, it must be pointed out that more than 50 per cent. of the members reside and practise in provincial towns, and have therefore usually no opportunity of taking part in elections and business meetings. On this account we strongly urge that on all occasions when a vote of the membership is taken the procedure should be by ballot. On our side, however, no opposition would be offered to a proposal to reduce the majority of votes necessary to election. If the entrance were in other respects more rigidly safeguarded, a bare majority would appear sufficient, as in the case of election by show of hands.

Further, it may be said that the interests of the Associates' membership are protected by the presence upon the Council of their four elected representatives. Your memorialists submit that this measure of representation is entirely inadequate, and is further discounted by the fact that, so far as they are aware, no effort has ever been made by an Associate member of the Council to systematically inform himself of the views of the class he is supposed to represent. In these circumstances the representation becomes merely nominal, without weight in the deliberations of the Council. Your memorialists appeal for more adequate and effective representation, and beg to urge that they should be allowed to nominate their own candidates for the Council, instead of the nomination paper requiring a majority of Fellows in favour of the nominee.

For convenience of reference the points submitted in this memorial may be summarized as follows:—

(1) That your committee should give careful consideration to the circumstances which led up to the recent demand for a poll and its results, so that incidental matters may be regarded in their proper light.

(2) That the report of your committee should contain an indication of its views as to the respective status of Fellows and Associates, and matters pertaining thereto which have been referred to in this memorial.

(3) That by some modification of the Special Examination which would attach the same importance to actual architectural work as to abstract knowledge means should be provided and recognized by which candidates may be elected as Associates, who, on account of age and busy practice, are reluctant to sit for the ordinary examination.

(4) That the dignity of the Institute would be augmented if the Fellowship were reserved for distinguished men of high personal achievement, and if the present policy were abandoned.

(5) That all voting on questions of policy and of membership be by a poll of the whole electorate. An inexpensive method would not be difficult to devise, which would make use of a detachable portion of the Journal insets.

(6) That the representation of the Associates' membership upon the Council should be increased and measures taken to make it more truly representative.

In conclusion, your memorialists entirely disclaim the hostility and organized opposition to the Council with which they have been credited; they would if allowed have been glad to be represented before your committee, with the hope of getting due consideration given to their views. Your memorialists are actuated solely by a conscientious desire to remedy the grave dissatisfaction which undoubtedly exists, and to promote a much-needed reform in the procedure connected with the Fellowship of the Institute.

The Institution of Heating and Ventilating Engineers are holding a summer meeting at Bath on Monday, Tuesday and Wednesday next week. A paper on "The Warming of Steamships" will be read by Mr. Charles R. Honiball, M.I.M.E., and another on "The Labour Problem" by Mr. F. S. Russell.

Waring & Gillow's new Premises.—The chief interior feature of Messrs. Waring & Gillow's new premises in Oxford Street is the rotunda, measuring about half the diameter of the dome of St. Paul's Cathedral and 80ft. in height. This novel departure in a business establishment will be used as a reception-room and for the display of furniture and showcases. More than a hundred galleries, averaging 60ft. by 30ft., run through the premises, eighteen elevators giving access to the floors.

Trade and Craft.

Lifts in Modern Offices.

At the fine new block of offices known as Caxton House, Westminster, just completed by Messrs. Holloway Brothers from the designs of Mr. J. S. Gibson, F.R.I.B.A., a noteworthy lift service has been installed. There are three high-speed electric passenger lifts side by side in one large well-hole. The centre one is "Express," not stopping until the fifth floor is reached, while the two at the side serve all floors. In order that there may be no unnecessary delay, an indicator shows the exact position of each lift cage. This is a great convenience, and will be much appreciated by passengers. Each lift is controlled by a small switch fixed in the cage, and the acceleration is very smooth, being entirely free from the unpleasant jumps and jerks so often felt on even slow-running lifts. Should the attendant release his hold on the controlling switch, the lift would automatically stop. When the lift is at rest the lever operating the controlling switch can be withdrawn and taken away, thus preventing access by unauthorised persons. Naturally, the question of safety to passengers has been carefully provided for. The lift cages are each suspended by four steel wire ropes, and an efficient safety apparatus is arranged to stop the cage in the event of any of the ropes stretching or breaking. The lifts are stopped automatically at extremes of travel; should the cage exceed the correct limit of travel by even a few inches all current is cut off. We believe this is the first instance in London of a range of three high-speed electric lifts fixed side by side, although we understand the makers of these lifts—Messrs. Archibald Smith & Stevens, of Battersea—recently erected at some offices at Newcastle-on-Tyne a service of four lifts arranged round a large central entrance hall.

Compoboard.

From time to time many substitutes for plastering have been put on the market. One of the best and most extensively used is "Compoboard," which has now become an ordinary commodity in the building trade. This material consists of strips of wood placed side by side so as to alternate the grain and so resist warping, covered on the outside with sheets of cardboard. The cardboard and wood are held together by a strong and fire-resisting adhesive. In the process of manufacture the materials are subjected to great pressure, and thus become compact and rigid. "Compoboard" can be sawn, nailed, screwed and glued like ordinary boards, and of course it has the additional advantage of being free from warping and shrinking. It is made in large sheets and is cheap. Swedish "Compoboard" is made in sheets 4ft. wide and from 8ft. to 18ft. long, in two thicknesses, namely, $\frac{1}{4}$ in. and $\frac{3}{8}$ in. The surface on both sides being smooth, true and non-absorbent, it can be papered, painted, distempered or otherwise finished immediately after fixing. It is undoubtedly an admirable substitute for plastering, and much superior to matchboarding. As can be well understood, for lining temporary buildings it is excellent. The sole agents for the supply of Swedish "Compoboard" in this country are Messrs. Ltd., of 79 $\frac{1}{2}$, Gracechurch Street, London, E.C.

Covering Reinforced Concrete Roofs.

On previous occasions we have referred in these columns to that excellent roofing material "Ruberoid," with the form and substance of which most of our readers are no doubt acquainted. This material is free from any liability to crack, melt or run, and it is claimed to be not only more durable but cheaper than any similar material. For the moment we wish to refer to a recent contract which has been executed in "Ruberoid,"

more especially in respect to its application in connection with reinforced concrete structures. Messrs. R. W. Blackwell & Co., of City Road, E.C., have recently supplied "Ruberoid" for covering the whole of the flat concrete roofs, 58,500 cub. ft. in all, constructed on the Hennebique system, at the new goods warehouse in New Bridge Street, Newcastle-on-Tyne, for the North-Eastern Railway Co. The manner in which the "Ruberoid" was laid should be noted. It was put on the concrete in two thicknesses, so that the jointing of the first layer was thoroughly covered, and the roof thus made completely waterproof. This contract was obtained in competition with asphalt and several similar materials.

A Novelty in Chimney Construction.

The smoky chimney trouble has called forth the ingenuity of innumerable inventors, but notwithstanding the many forms of patent chimney-pots on the market it is apparent from the continued addition of patented or registered designs that the trouble is still with us. No doubt the reason why the difficulties of constructing smokeless chimneys have not been solved long ago is that in the very nature of things troubles must arise which prevent the smoke being carried away by an ordinarily constructed chimney-pot and flue. If, for instance, houses are built surrounded by trees or overtopped by large buildings—and they must occasionally be built in such situations—it is only to be expected that there should be a tendency for downdraught to be caused by high wind. Again, with long chimneys, cold weather and light breezes there will be insufficient draught. Cows, tall-boys, moving pots and other forms are advocated and adopted, but there is no doubt that there are a good many forms in simple stationary chimney-pots which have quite enough efficiency for practical purposes, so that there is considerable variety to choose from. Among the best of the kind we have seen are some ordinary terra-cotta "Notlor" patent chimney-pots made by Messrs. Notley & Taylor, of Finsbury Pavement House, E.C. The special advantages of these are that they are not so disfiguring to the chimney stacks as many of the patented forms, while a good many of them are of distinctly pleasing form. These "Notlor" chimney-pots are made in a form which has very considerable advantages apart from the question of improving the draught. They are made so as to be self-fixing, detachable and interchangeable. They are not seated as ordinarily upon the brickwork and flanching with mortar, but seated upon a small base which can be used if desired as the chimney-pot itself. This base is of the form illustrated on this page.

It will be seen that the sleeve fits into the flue, while the flange covers the top of the chimney so as to throw off the rain without the necessity of flanching with mortar, which, as everyone knows, is disintegrated by the weather after a few years; flanching, too, cannot be done without trouble and the risk of the free passage of the chimney being blocked by the collection of soot at this point, or of putting the chimney out of the upright. These chimney caps form the bases for any number of experiments in the attaching of different forms of wind-guards so as

to ascertain which form is best suited to any particular circumstances. The cost of bedding and pointing these chimney caps is only 2 $\frac{1}{2}$ d. per ft. run, whereas bedding and flanching ordinary dwarf pots in cement, or with tiles and cement, is estimated at from 5 $\frac{1}{2}$ d. to 7 $\frac{1}{2}$ d. respectively. The price of these self-flanching caps is given as 3s. 6d.; consequently their extra cost is more than covered by the saving in the cost of fixing. Messrs. Notley & Taylor are also specialists in the construction of fireplace openings, stoves, &c., flues and stacks, and they have a number of patents which are deserving of careful study by all interested in building construction.

A Novel Catalogue.

We have received a copy of a new catalogue issued by the Clydesdale Iron Foundry Co., of 210, Upper Thames Street, London, E.C. This is of somewhat novel form as regards the binding, which consists of screw-top paper fasteners, which can easily be unscrewed so as to allow sheets to be abstracted and replaced without damaging the book. By this means it is no longer necessary to carry about a cumbersome book for clients to select from; a few pages temporarily removed will answer the purpose. There is also an advantage in the fact that the company can print sheets of any new patterns to exactly correspond with the book, and these can be posted to customers for insertion in the catalogue without the expense of re-printing the whole catalogue. In this way the Clydesdale Co. estimate to be able to keep months ahead of their competitors, and in some cases years. There are fashions in grates and chimneypieces, and firms are constantly adding new designs which there is no doubt architects would like to keep a note of; this new form of catalogue certainly has distinct advantages in affording facilities in this respect. With regard to the designs in this catalogue, there are many which are distinctly superior to the usual kind of fire-grate and mantel, and we are glad to welcome these. Firms, of course, must cater for all classes of the public, and it cannot be expected that the designs should be pleasing to everybody, but we are glad to see this company endeavouring to set a better standard of taste.

A Steel Catalogue.

The latest edition of Messrs. Homan & Rodgers' catalogue of constructional steel-work and fireproof floors is still in the admirable neat pocket-book form that it has taken before, being bound in leather and printed on excellent paper. The increased adoption of steel in buildings renders this book of great service, for not only is it excellent for reference in a business way, but it contains an immense amount of information respecting methods of calculation that can be studied by students with great advantage. One admirable feature of the book is the way in which the standard bases, caps and connections for stanchions are illustrated; also grillage foundations. Some years ago we called attention to the value of the demonstrations in this catalogue, and we now repeat that the formulæ and tables given in it are worthy of most careful study. The form of grillage foundation for columns illustrated is without cast-iron stiffeners; these, however, are used in the best practice. In addition to the tables of strengths and formulæ, &c., at the end of the volume there are some useful tables of the weights, areas and circumferences of steel bars, weights of bolts and nuts and various substances, decimals of fractions of an inch, metric weights and measures and their English equivalents, moments of inertia, squares, cubes, roots, logarithms, reciprocals, sines. Homan's well-known fireproof floors in fireclay brick, and also in steel joists and reinforced concrete, we are glad to see illustrated and described.

Complete List of Contracts Open.

With a few exceptions, news of Contracts Open are not repeated after they have been published once in these columns, so that readers will find particulars in our previous issues of other contracts that still remain open.

Unless expressly stated to the contrary all deposits required for bills of quantities, &c., are returned on receipt of bona-fide tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair-wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

June 7. Llanfechell.—*Erection of a new Council school at Llanfechell, for the Anglesey Education Committee.* Plans and specifications may be inspected at the offices of the county architect, J. Owen, F.R.I.B.A., at Menai Bridge and Holyhead. Tenders, under seal and endorsed "Llanfechell Council School," to be delivered to R. H. Williams, secretary of Education Education Offices, Llangefni, by not later than 10 a.m. on June 7.

June 7. Oswestry.—*Re-flooring of certain rooms in the Council School.* Plans and specification may be seen at the offices of J. C. Bull, solicitor, Oswestry. Forms of tender will be supplied upon application, and should be returned to J. C. Bull, sealed and endorsed "Tender for Oswestry Council School," not later than noon on June 7.

June 7. Stockport.—*Erection of the first portion of an observation block at Dialstone Lane Hospital.* The plans, drawings and general conditions may be inspected at the office of the architect, G. H. Brady, Borough Chambers, St. Peter'sgate, Stockport, and specifications and quantities will be supplied by him on payment of a deposit of £1 rs. Sealed tenders, endorsed "Hospital Building Contract," addressed to the Chairman of the Health Committee, must be delivered to Robert Hyde, town clerk, Town Clerk's Office, Stockport, not later than noon on June 7. Fair wages clause.

June 7. Huddersfield.—*Supplying and fixing of skylights at the Artizans' Dwellings, for the Corporation.* Plans, specifications and general conditions may be seen, and bills of quantities and forms of tender obtained on application at the offices of the Borough Engineer, 1, Peel Street. Sealed tenders, endorsed "Tender for Skylights," signed in the handwriting of the tenderer or his agent, and addressed "Town Clerk, Town Hall, Huddersfield," must reach him not later than 10 a.m. on June 7.

June 8. Salcombe.—*Erecting two houses and three shops at Salcombe.* Drawings and specification can be seen on application to the "Times" Office, Salcombe, and tenders to be delivered to J. Wills, Bar Lodge, Salcombe, before noon on June 8.

June 8. Carlisle.—*Erection of a caretaker's cottage at the Meeting of the Old and New Waters, Gelsdale, for the Corporation.* Persons desirous of tendering for the above works may inspect the drawings, specification, stipulations and conditions of contract, and obtain a copy of the bill of quantities and form of tender at the office of Henry C. Marks, M.I.C.E., city engineer and surveyor, 36, Fisher Street, Carlisle, on deposit of 10s. 6d. Sealed tenders, endorsed "Tender for Cottage," to be delivered at the City Engineer's Office, not later than 10 a.m. on June 8.

June 8. Eastbourne.—*Internal alterations and repairs for the Guardians, at Avenue House, The Avenue, Eastbourne, according to the plan and specification, &c., prepared by the architect to the Board, F. G. Cooke, 2, Hyde Gardens, Eastbourne.* Copies of the plan and specification can be seen at the office of the Architect. Sealed tenders to be addressed "To the Chairman," and endorsed "Tender for Alterations at Avenue House," to be delivered at the Board-room, Union Workhouse, not later than 2 p.m. on June 8.

June 9. Snodland.—*Building a mortuary at the cemetery, for the Parish Council.* Plans and specification can be seen at the office of S. Hilder, clerk, Pelham House, Snodland, to whom tenders endorsed "Tender for Mortuary" must be returned by June 9.

June 9. Dunblane.—*Mason, iron, joiner, plumber, slater, plaster, painter and glazier work for the erection and completion of the Queen Victoria School and Memorial to Scottish Sailors and Soldiers, houses connected therewith and offices; also for drainage, fencing and laying-out of ground; and for roads, sewers, water and gas supplies, and relative works.* The relative schedules may be had on application to the architect, J. A. Campbell, 124, St. Vincent Street, Glasgow, where the plans and drawings, specifications and measurements will be exhibited and explained. Printed copies of the conditions of contract, specifications and measurements and general conditions will be supplied to intending offerers on a deposit of £2. The schedules shall be priced and extended, but it is intended to accept a lump sum from one offerer for the whole work. No offers for separate works will be entertained by the Executive Council, but contractors will be allowed to sub-contract with the approval of the Building Committee. The schedules and tender must be sent in a sealed envelope, which will be supplied to intending offerers, and addressed to "The Executive Council, Queen Victoria School, care of R. Addison Smith, Esq., honorary treasurer, 19, Heriot Row, Edinburgh," not later than June 9.

June 9. St. Austell.—*Erection of a new gallery and certain other alterations at the Bible Christian Chapel, Bugle.* Plans and specifications may be seen and full particulars obtained at the office of the architect, F. C. Jury, No. 1, Alma Villas, Tregonissey Road, St. Austell. Tenders, sealed and endorsed "Bugle Chapel Tenders," must be sent to the Rev. W. H. Webber, Fernleigh, Bodmin, on or before June 9.

June 9. Leith.—*Terazzo work in connection with the erection of the new porch at Leith, for the Parish Council.* Contractors desirous to tender for the work will, on application to James Miles, clerk, 45, Charlotte Street, Leith, be supplied with specification and schedule of

quantities, on payment of a deposit of £1 rs., not later than June 2. No offer will be considered unless accompanied by the priced schedule, which must be delivered by June 9.

June 9. Morriston.—*"Libanus" new schoolroom.* Persons desirous of tendering for the above can inspect plans and specifications and obtain all particulars at the offices of Charles S. Thomas, architect and surveyor, Wind Street, Swansea. Tenders to be sent to George Rowe, Llanllienw, Morriston, on or before June 9, endorsed "Tender for Libanus Schoolroom."

June 9. Maidenwell.—*Erection of two pairs of cottages at Maidenwell, in the county of Lincoln, for the Corporation of Basingstoke.* Plans may be seen and bills of quantities obtained on application at the office of R. H. Fowler, architect, Louth, to whom tenders are to be sent by June 9.

June 9. Cardiff.—*Erection of a cookhouse at the Cardiff Workhouse, according to plans and specification prepared by the architect, Edwin Seward, F.R.I.B.A., Queen's Chambers, Cardiff, from whom bills of quantities may be obtained on payment of £2 2s. Forms of tender may be obtained from the Architect, and must be returned to Arthur J. Harris, clerk, Union Offices, Queen's Chambers, Cardiff, not later than 10 a.m. on June 9, endorsed "Tender for Cookhouse."*

June 9. Greetland.—*Erection of three houses in Hoult's Lane, Greetland.* Plans and specification may be seen and bills of quantities obtained from F. F. Beaumont, architect and surveyor, Southgate Chambers, Halifax, to whom tenders must be sent by June 9.

June 9. Churchtown.—*Extensive repairs to Kilbride Church, co. Meath, for the Very Rev. T. Casey, P.P., Churchtown, Navan, co. Meath, to whom the tenders are to be sent, endorsed "Tender for Kilbride Church," by June 9.* The plans and specification can be seen at the Presbytery, Churchtown, or at the office of William H. Byrne & Son, architects, 20, Suffolk Street, Dublin.

June 9. Cardiff.—*For the following works, for the Glamorgan Quarter Sessions and County Council—New police-station at Blaengwynfi; new police-station at Llanbradach; building a wall round the land at the rear of Ton Pentre police-station and court. Fair wages clause. Plans and specifications of the respective works may be seen and copies of the bills of quantities obtained at the following places:—Work No. 1, Port Talbot police-station; Work No. 2, Caerphilly police-station; Work No. 3, Ton Pentre police-station; and for all the works at these offices. Sealed tenders are to be delivered to W. E. R. Allen, deputy-clerk of the County Council, Glamorgan County Council Offices, Westgate Street, Cardiff, together with the full names and addresses of two substantial sureties, not later than June 9, marked outside "Tender for Blaengwynfi Police-station," "Tender for Llanbradach Police-station," or "Tender for Wall," as the case may be.*

June 11. Little Heath.—*Erection and completion of a new elementary school and teachers' residence.* Persons desirous of tendering for the work may see the drawings, specification, agreement, &c., at the County Surveyor's Office, Hatfield, on and after May 28 between 10 and 4, except on Saturday, when they will be on view from 10 to 12 noon. A copy of the schedule of works and prices (quantities) and form of tender can be obtained at the County Surveyor's Office upon payment of £2 2s. Sealed tenders, endorsed "Tender for School and Teachers' Residence, Little Heath," must be delivered to Urban A. Smith, county surveyor, County Surveyor's Office, Hatfield, not later than 5 p.m. on June 11.

June 11. Swindon.—*Erection of laundry buildings and disinfecter house, for the Guardians.* Plans and specifications can be seen and particulars obtained on application at the office of the architect, R. J. Beswick, M.S.A., 10, Victoria Road, Swindon. Sealed and endorsed tenders to be delivered to John P. Kirby, clerk to the Guardians, Union Offices, Victoria Road, Swindon, on or before 5 p.m. on June 11.

June 11. Burley.—*Additions to the council school.* Persons desirous of tendering may see plans, specification and conditions of contract, and obtain bills of quantities, at the office of W. J. Taylor, county surveyor, The Castle, Winchester, between 9 a.m. and 5 p.m. (Saturdays 9 a.m. to 1 p.m.) on payment of £2 2s. Deposits must be made by cheque payable to Hants County Council and crossed Bank of England, or particulars will not be sent. Tenders, endorsed "Proposed Additions, Burley Council School," are to be delivered to H. Barber, clerk of the County Council, The Castle, Winchester, on or before 10 a.m. on June 11.

June 11. Blantyre and Larkhall.—*Bricklayer, mason, joiner, slater and plaster, plumber, iron and painter works of public slaughterhouses, to be erected at Blantyre and Larkhall.* Schedules may be obtained from Gavin Paterson, architect, Hamilton, on payment of 10s. 6d. Tenders must be lodged with W. E. Whyte, district clerk, Hamilton, on or before June 11.

June 12. Halifax.—*Erecting three blocks of cottage homes in Upper Washer Lane, Halifax, for R. D. Ward, J.P.* Plans and specifications may be seen and bills of quantities obtained from Longbottom & Culpin, architects and surveyors, George Street, Halifax, to whom tenders, marked "Cottage Homes," are to be delivered by June 12.

June 12. Bristol.—*Additions and alterations to the Club-house, Fairland, for the Bristol and Clifton Golf Club.* Persons desirous of tendering can see the plans and specifications, and obtain bills of quantities, at the offices of Bernard & Son, 4, St. Stephen's Chambers, Baldwin Street, Bristol, on and after May 31. Tenders to be delivered by June 12.

June 12. Rugby.—*Proposed new wing to the hospital of St. Cross.* Bills of quantities and forms of tender may be obtained at the offices of the architect, J. D. Hoper, Albert Street, Rugby, on payment of £1 rs. Fair wages clause. Sealed tenders, on forms supplied, must be delivered before noon on June 12, addressed to the Chairman of Children Wards' Committee, and endorsed "Tender for New Wing."

June 12. London, S.W.—*Erection of a storehouse for boats at Battersea Park, S.W., for the London County Council.* Persons desiring to submit tenders may inspect the drawings, and obtain the specification, bills of quantities, form of tender, and other particulars at the Architect's Department, 75, Pall Mall East, S.W., upon payment to the Cashier of the Council, at the County Hall, Spring Gardens, of £1. Tenders must be upon the official forms, and the printed instructions contained therein must be strictly complied with. Fair wages clause. Each tender is to be delivered at the County Hall, in a sealed cover, addressed to the Clerk of the London County Council, Spring Gardens, S.W., and marked "Tender for the erection of a Boat-house at Battersea Park." No tender will be received after 10 a.m. on June 12. Any tender which does not comply with the printed instructions for tender may be rejected.

June 12. Cheltenham.—*Construction of an engine-shed at Cheltenham.* Plans and specification may be seen and forms of tender and bills of quantities obtained at the office of the Engineer at Gloucester Station between 10 a.m. and 4 p.m. Tenders, marked outside "Tender for Engine-Shed, Cheltenham," will be received by G. K. Mills, secty., Paddington Station, London, by June 12.

June 12. Rhymney.—*Alterations and additions to Zion Congregational Chapel, in accordance with plans and specification prepared by James & Morgan, F.R.I.B.A., architects, Cardiff.* Plans and specification may be seen and further particulars obtained either at the Architects' Office, or on applying to Elias Jones, "Cyclops," Rhymney. Tenders, sealed and endorsed "Tender for Zion Chapel," to be in the hands of Elias Jones not later than June 12.

June 12. Llanfair Caereinion.—*Repairs and alterations to Penarth Congregational Church.* Plans and specifications to be seen with J. P. Jones, Glôg, Llanfair Caereinion, to whom sealed and endorsed tenders should be sent on or before June 12.

June 13. Portland.—*Erection of the Wesleyan Methodist Church, Easton Square.* Bills of quantities may be obtained from the architects, La Trobe & Weston, F.R.I.B.A., 44, Corn Street, Bristol, or from R. Pearce, 3, Easton Square, Portland, on payment of a deposit of a £2 2s. Tenders to be sent in before June 13.

June 13. London, S.W.—*Erection of two additional ward blocks, recreation hall, and staff quarters at Tooting Bec Asylum, Tooting, S.W., for the Metropolitan Asylums Board, in accordance with drawings and specification prepared by W. T. Hatch, M.I.C.E., M.I.M.E., engineer-in-chief. Drawings, specification, bills of quantities, conditions of contract and form of tender may be inspected at the Office of the Board, Embankment, E.C., and bills of quantities and form of tender obtained upon payment of a deposit of £5. Tenders, addressed as noted on the form, must be delivered at the Office of the Board not later than 10 a.m. on June 13.*

June 13. Halifax.—*Erection of two dwelling-houses in Middle Dean Street and Green Lane, West Vale, and alteration to adjoining premises.* Plans may be seen and bills of quantities obtained upon application to T. Kershaw, A.R.I.B.A., architect, L. and Y. Bank Chambers, Halifax, to whom sealed tenders are to be delivered not later than June 13.

June 13. Treharris.—*Carrying-out alterations at Commercial Street, Nelson, Glam., for the Treharris Co-operative Society, Cardiff Road, Treharris.* Plans and specification may be seen at the office of W. Dowdswell, architect, Treharris. Sealed endorsed tenders to be sent to the Secretary on or before June 13.

June 14. Penrith.—*Heightening the Presbyterian Church of England, Penrith, lengthening nave and erecting chancel, organ-chamber, minister's and deacons' vestries, class-rooms, &c.* Plans can be inspected and all information obtained at the office of Stephen Shaw, F.R.I.B.A., architect, Kendal, where quantities and specifications can be had till June 14, upon which day endorsed tenders are to be sent in. A duplicate set of plans can be seen in the Church Hall from 10 till 4.

June 15. Grimsby.—*Erection of proposed new hall, Garibaldi Street, for the Ancient Order of Foresters.* Plans, specifications, form of tender, and all particulars may be obtained at the office of the architect, Herbert Heap, A.M.I.C.E., architect and surveyor, Osborne Chambers, between 9 a.m. and 6 p.m. Sealed tenders, which must be endorsed "Tender for Proposed New Hall," and addressed to T. Steel, secty., must be delivered at No. 164, Oxford Street, Grimsby, not later than June 15.

June 15. Gorseinon.—Erection of a new Co-operative Stores at High Street, Gorseinon. Plans and specifications may be seen with William Williams, architect, Frondeg, Pontardulais. Sealed and endorsed tenders to be sent to the Secretary, Pontardulais and Gorseinon Industrial Co-operative Society, Ltd., Pontardulais, on or before June 15.

June 15. Beckington.—Restoring the tower of St. Gregory's Church, Beckington, Bath. Plans and specifications may be inspected on application to W. J. Hole, Beckington, where sealed tenders are to be sent by June 15.

June 15. Wakefield.—For the builders', joiners', slaters', plumbers', plasterers', painters', &c., work at following schools, for West Riding Education Committee:—New school at Robin Hood, Rothwell; Lepton provided school, additions, &c.; Bolton-on-Darney provided school, additions, &c.; Swinton; Kilnhurst provided school, alterations and repairs; Swinton Bridge provided school, alterations and repairs; Bawtry provided school, alterations and repairs; Thornton-in-Craven; Earby provided school, additions, &c.; Hoyland Common provided school, new bathroom, &c., in teacher's house. For quantities and further particulars apply to the County Architect's office. A deposit of £1 is required for each of the above schools. Cheques, &c., to be sent to the West Riding Treasurer. Sealed tenders, properly endorsed, to be sent to J. Vickers-Edwards, county architect, County Hall, Wakefield, not later than 10.30 a.m. on June 15.

June 15. London, N.—Erection of a bandstand, composed of brick, wood and tiles, at Finsbury Park, N., for the London County Council. Persons desiring to submit tenders may inspect the drawings and obtain the specifications, bills of quantities, form of tender and other particulars at the Architect's Department, 15, Pall Mall East, S.W., upon payment to the cashier of the Council, at the County Hall, Spring Gardens, S.W., of the sum of 10s. Tenders must be upon the official forms, and the printed instructions contained therein must be strictly complied with. Fair wages clause. Each tender is to be delivered at the County Hall, in a sealed cover, addressed to the Clerk of the London County Council, Spring Gardens, S.W., and marked "Tender for Bandstand at Finsbury Park." No tender will be received after 10 a.m. on June 15.

June 16. Knock.—Erection of one detached and two semi-detached villas at Kensington Road, Knock. Plans and specifications may be had at the office of Thomas Houston, architect and civil engineer, Kingscourt, Wellington Place, Belfast, with whom sealed and endorsed tenders are to be lodged by June 16.

June 16. Manchester.—Extension of the existing laboratory at the Davey Hulme Sewage Works, near Urmston. Drawings may be inspected and bills of quantities and tender forms may be obtained on application to the Secretary of the Rivers Department, Town Hall, Manchester. Tenders must be enclosed in the official envelope provided expressly for the purpose (otherwise the tender will not be considered), and delivered at the above office not later than 10 a.m. on June 16.

June 16. Falmouth.—Proposed girls' school at Clare Terrace. Tenders are invited for the erection and completion of the above, according to plans and specifications, which may be seen by appointment at the Municipal Offices, Falmouth, or at the office of the Architect, Sampson Hill, Green Lane, Redruth, from whom all particulars relating to the work may be obtained. Forms, upon which all tenders must be made, may be obtained from the Secretary or the Architect. Sealed tenders, endorsed "Tenders for Clare Terrace School," are to be sent to E. E. Armitage, secy., Municipal Offices, Falmouth, on or before June 16.

June 18. Exeter.—Alteration and extension of the existing buildings at the College Hostel, Castle Street, in accordance with drawings and specifications which may be seen at the offices of James Jerman, F.R.I.B.A., architect and surveyor, Bedford Circus, Exeter. Bills of quantities may be obtained on payment of the sum of £1 1s. Tenders, endorsed "College Hostel," to be sent to H. Lloyd Parry, town clerk, Exeter, on or before June 18.

June 18. Wimbledon.—Erection of seven cottages for Corporation's workmen, to be erected in the Durnsford Road, Wimbledon. Plans and specifications may be inspected and bills of quantities obtained at the Borough Surveyor's Office, Town Hall, Wimbledon, upon payment to the Borough Treasurer of a deposit of £2 2s. Sealed Tenders, addressed to the Chairman of the Electric Lighting Committee, and endorsed "Tender for Workmen's Dwellings, Durnsford Road, Wimbledon," must be delivered on or before noon on June 18.

June 18. Talgarth.—Repair of Llandefalle Church, Talgarth. Plans and specifications can be seen at Llandefalle Rectory on and after June 4. Tenders to be sent to Ernest V. Collier, M.S.A., architect, 4, Quay Street, Carmarthen, not later than June 18.

June 19. Brighton.—Erection of two pairs of farm labourers' cottages on land adjoining the Warren Farm schools, in the parish of Rottingdean. Copy of specification and form of tender, together with any further information, can be obtained on application to E. Wright, architect for the Guardians, at the Parochial Offices, where the plans may also be inspected. Sealed tenders, endorsed "Tender for Cottages," are to be addressed to B. Burfield, clerk to the Guardians, Parochial Offices, Prince's Street, Brighton, and delivered by 10 a.m. on June 19.

June 19. London, W.—Alterations and additions to the Paddington District Post Office, W. Drawings, specification and a copy of the conditions and form of contract may be seen on application to J. Wager, H.M. Office of Works, Westminster, S.W. Bills of quantities and forms of tender may be obtained at the same address on payment of £1 1s. Tenders must be delivered before noon on June 19, addressed to the Secretary, H.M. Office of Works, &c., Storey's Gate, London, S.W., and endorsed "Tenders for Paddington District Post Office Enlargement."

June 20. St. Andrews.—Erection of a new post-office at St. Andrews. Drawings, specification, and a copy of the conditions and form of contract may be seen on application to the Postmaster. Bills of quantities and forms of tender may be obtained from W. T. Oldrieve, H.M. Office of Works, Parliament Square, Edinburgh, on payment of £1 1s. Tenders must be delivered on or before June 20, addressed to the Secretary, H.M. Office of Works, &c., Storey's Gate, London, S.W., and endorsed, "Tender for St. Andrews Post-office."

June 20. Watford.—Erection of addition to and alterations of the Council Offices. The plans and specifications can be seen and bills of quantities obtained on application to D. Waterhouse, surveyor to the Council, 14, High Street, Watford. The sum of £1 1s. will be charged for the quantities. Sealed tenders, endorsed "Tender for Office Extensions," to be delivered to H. Morten Turner, clerk to the Council, 14, High Street, Watford, by noon on June 20.

June 20. Cheltenham.—Erection of new school buildings, to accommodate 1,100 children for the Gloucester Road district of Cheltenham, in accordance with plans, specifications and conditions of contract to be seen at the offices of Charters & Smithson, architects, 17, Regent Street, Cheltenham. Early application is requested for bills of quantities, which will be supplied by the architects upon receipt of a deposit of £2 2s. Tenders, sealed and endorsed, must be delivered to William Preston, secy., Education Offices, Rodney Road, Cheltenham, by noon on June 20.

June 21. Fishguard.—Building a new chapel. Plans and specification may be seen on application to the architects, George Morgan & Sons, F.R.I.B.A., A.R.I.B.A., 24, King Street, Carmarthen, or to D. B. Phillips, surveyor, High Street, Fishguard, to whom sealed tenders are to be sent on or before June 21.

June 22. Lower Sandhurst.—Building a new school for 250 scholars at Lower Sandhurst, Berks. Builders desirous of tendering are required to send in their names on or before June 12, together with a deposit of £3 3s. for bills of quantities, which will be supplied by post. Plans, specifications and form of contract will be open for inspection at the Education Secretary's office. Tenders must be delivered at the office of the Education Secretary, The Forbury, Reading, on the form and in the envelope provided, not later than the first post on June 22.

June 23. Brentwood.—Remodelling one of the blocks of buildings at the Essex County Asylum so as to form attendants' quarters. Drawings and specifications and form of contract may be inspected at the office of the county architect, Frank Whitmore, Duke Street, Chelmsford, between 10 a.m. and 4 p.m. on any working day except Saturdays. Persons desirous of tendering must send in their names and addresses to the County Architect not later than noon on June 4. Sealed tenders, on the form supplied, endorsed "Tender for Female Attendants' Block," should be delivered to W. P. Gepp, clerk to the Committee of Visitors, Chelmsford, not later than 10 a.m. on June 23.

June 25. Redruth.—Erection and completion of the West Cornwall Miners' and Women's Hospital, comprising an operating theatre, with adjoining rooms and corridors, according to plans and specifications which may be seen by appointment at the office of Sampson Hill, architect, Green Lane, Redruth. Sealed tenders, endorsed "Tender for Operating Theatre," to be sent to C. Tweedy, hon. secy., Capital and Counties Bank, Redruth, not later than 10 a.m. on June 25.

June 27. London, S.W.—Erection of new boardroom and offices, &c., and an extension of the workhouse in Vallis's Yard, Buckingham Palace Road, S.W., for the Guardians. The plans and specifications may be inspected and bills of quantities obtained on application at the office of the architect, Francis J. Smith, F.R.I.B.A., Parliament Mansions, Victoria Street, Westminster, between 10 a.m. and 4 p.m. from June 6 to 11. Tenders on the form supplied are to be addressed and delivered to Thomas Worlock, clerk to the Guardians, Guardians' Office, St. George's (Hanover Square) Hall, Mount Street, W., at or before 10 a.m. on June 27.

No date. Dulwich.—Completion of St. Barnabas' Church. Contractors having experience of church building and desirous of tendering are requested to send their names to Oliver, Leeson & Wood, architects, Milburn House, Newcastle-on-Tyne. From the list submitted a limited number will be invited to compete.

ENGINEERING.

June 7. Handsworth.—Construction of a storage tank in Hennebique's patent ferro-concrete at the Public Baths, Grove Lane, Handsworth. Plan, specification and conditions of contract and form of tender may be obtained at the offices of the architect, J. P. Osborne, F.R.I.B.A., of 95, Colmore Row, Birmingham, on depositing with him the sum of £2 2s. Fair wages clause. Tenders, on the prescribed form, enclosed in sealed envelopes, endorsed "Tender for Storage Tank," must be delivered to H. Ward, clerk, the Council House, Handsworth, near Birmingham, not later than noon on June 7.

June 8. Melrose.—Repair of two bridges on the main road, near Buckholm, the work consisting of stripping arches and haunches, covering them with coat of concrete 24 ins. thick, building tie walls, &c., for the Roxburghshire County Council. Plans and specifications may be seen and schedules obtained at the office of C. Monteath, C.E., Newton St. Boswells. Sealed tenders, marked "Tender for Buckholm Bridges Repairs," to be lodged with A. Murison Small, W.S., district clerk, Melrose, not later June 8.

June 9. Paignton.—Supply, delivery and laying of a 7 in. cast-iron water-main, together with the requisite meter, sluice valves, air valves, washouts and other fittings, meter-house and store, and other works in connection with Paignton water supply in the parishes of Marldon and Paignton, from Churchcombe Cross to the Paignton and Churston Ferra's parish boundary. Drawings may be seen and copies of specification, bills of quantities, and forms of tender obtained at the office of the

engineer, Frederick W. Vanstone, Palace Chambers, Paignton, on payment of £5. Sealed tenders, upon the form provided, endorsed "Paignton Waterworks," are to be addressed to James R. Mill, clerk to the Council, Town Hall, Paignton, on or before June 9.

June 9. Hull.—Construction of a covered concrete service reservoir at Keldgate, to hold about ten million gallons. Drawings may be seen and copy of specification and form of tender may be obtained at the City Water and Gas Engineer's Office on payment of £2. Cheques and postal orders to be made payable to T. G. Milner, city treasurer, Hull. Tenders, endorsed "Tender for Covered Service Reservoir," are to be addressed to the Chairman of the Water and Gas Committee, and delivered at the Town Clerk's Office not later than June 9.

June 9. Great Harwood.—Labour (only) required in taking down and rebuilding the small bridge at Dean, for the U.D.C. Drawings and specifications may be seen between 9 and 10 a.m. on application to A. H. Dunkin, surveyor to the Council, to whom tenders, sealed and endorsed "Dean Bridge," are to be delivered not later than June 9.

June 11. London, E.—Supply and delivery at the sewage outfall works, East Ham, of the necessary steam, exhaust and other piping required in connection with the new pumping plant being laid down there. Particulars, form of tender and specification may be obtained upon application to A. H. Campbell, M.I.C.E., borough engineer, Town Hall, East Ham. Fair wages clause. Tenders to be delivered, addressed to the "Chairman of the Public Health Committee, Town Hall, East Ham, E.," and endorsed "Steam Piping," not later than noon on June 11.

June 11. Portsmouth.—Supply of tramway feeder cables. The specification, with general conditions and form of tender, can be obtained on application to the Town Clerk, Town Hall, Portsmouth, but a deposit of £5 5s. must accompany the application. Drawings may be seen at the office of V. G. Lironi, M.I.M.E., A.M.I.E.E., tramways engineer, Vivash Road, Fratton, Portsmouth. Fair wages clause. Tenders must be delivered to the Town Clerk, Town Hall, Portsmouth, not later than 10 a.m. on June 5.

June 11. London, N.—Supply and erection of one cold water-softening plant, capacity about 2,000 gallons per hour continuous working. Plans may be seen, and conditions, specification and form of tender obtained at the office of the electrical engineer to the Council, E. Calverly, Electricity Works, Squires Lane, Finchley, N. A Winchester quart sample of the water will be sent to firms desiring to tender on receipt of 5s. (not returnable) to cover expenses of sending same. Sealed tenders, marked on the outside "Electricity Works, Section XXVII," to reach E. H. Lister, clerk to the Council, Council Offices, Finchley, before 5 p.m. on June 11.

June 12. Nuneaton.—Supply, delivery and erection of one 200-hp. steam dynamo, for the U.D.C. Copies of the general conditions, specification and form of tender may be obtained on payment of £2 2s. Additional copies of the specification may be had on payment of 10s. per copy, which amount will not be returned. Sealed tenders, endorsed "Tender for Steam Dynamo," and addressed to the Chairman of the Electric Light Committee, Electricity Works, Nuneaton, will be received up to noon on June 12.

June 12. Kempston.—Water-supply. A.—The provision, delivery, laying, and jointing in the rural district of Bedford of about 550 tons of cast-iron pipes (principally 7 in. and 8 in.) and for the construction of certain ancillary works; and B.—The supply, delivery, laying and jointing of about 5 miles 325 yds. of 7 in., 6 in., 4 in. and 3 in. cast-iron socket pipes, with appendages, including all necessary sluice and air valves, hydrants, and other works, for the water-supply of the urban district of Kempston. Plans, specifications and conditions may be seen as regards contract A at the offices of the engineer, George F. Deacon, 16, Great George Street, Westminster, S.W., and as regards contract B at the offices of the engineers, Beesley, Son & Nichols, 11, Victoria Street, Westminster, from whom respectively specifications, bills of quantities and forms of tender can be obtained on payment of £5 for each contract. Sealed tenders, endorsed "Tender for Waterworks Contract A" (or B), to be addressed to William Payne, clerk of the Council, and sent to the U.D.C. Offices, Bedford Road, New Town, Kempston, at or before noon on June 12.

June 14. Battle.—Supply, delivery and laying of about 1,620 yds. of 4 in. water main, and the necessary valves in connection with the same, from the town of Battle to the Battle Union Workhouse. Sealed tenders, endorsed "Tender for Mains, &c.," and addressed to Charles Sheppard, clerk to the U.D.C., Battle, to be sent in not later than noon on June 14. Plan, specification, and general conditions may be inspected at the offices of the Clerk, at Battle.

June 14. Wellingborough.—Supply and erection of a steel building with corrugated sheeting, 60 ft. by 25 ft. by 22 ft. 6 ins. high. Drawings and specification may be had by application to the Northamptonshire Direct Castings Co., Ltd., Wellingborough. Tenders will not be considered after June 14.

June 16. Birkenhead.—Excavating and making culverts for steam mains at the Union Workhouse, Tranmere, for the Guardians. Also tenders for supplying and fixing steam mains at the Union Workhouse. Persons desirous of tendering may obtain copies of quantities upon payment of a deposit of £2 2s. Such copies of quantities may be obtained between 10 and 5 upon application to the Guardians' Liverpool, Edmund Kirby, F.R.I.B.A., 5, Cook Street, Liverpool. Sealed tenders, signed and endorsed "Tenders for Excavating and Making Culverts for Steam Mains" or "Tender for Supplying and Fixing Steam Mains," as the case may be, to be delivered to John Carter, clerk, Poor Law Offices, Conway Street, Birkenhead, on or before 10 a.m. on June 16.

June 16. Johannesburg.—Watering cars and spare parts. Supply and delivery, after erection for inspection at makers' works, of three electric watering cars for use on the Council's tramway system, together with

various spare parts for the cars. Tenders are to be made for delivery f.o.b. at any port suitable for shipment to South Africa, but separate prices must also be given for (a) delivery of the cars and spare parts at the car sheds, Johannesburg, (b) the erection of the cars complete in Johannesburg. Tenders are to be addressed to the Town Clerk, Municipal Offices, Johannesburg, and must reach him not later than June 16. The general conditions, specification, and form of tender may be seen on and after May 10 at the offices of the Council's consulting engineers, Mordey & Dawbarn, 82, Victoria Street, S.W., and may be obtained from them on payment of £5 5s. Further copies of the general conditions, specification and forms of tender may be obtained from the Consulting Engineers on payment of 10s., which will not be returned.

July 17. Saltash.—Construction of a steam ferry bridge, to run on chains across the River Tamar at Saltash Passage. Plans and specification of the bridge may be obtained from the Town Clerk. The bridge is to be delivered on chains at Saltash within twelve months of the acceptance of a tender. Sealed and marked tenders to be sent to Fred. Et. Claverton, town clerk, Saltash, not later than July 17.

June 18. Middlezoy.—Supplying and fixing a steel flooring bridge at Greylake's Fosse, Middlezoy, Somerset, in part substitution for the existing bridge and for other alterations of the approach thereto, for the Kings Sedgemoor and Cary Valley District Drainage Board. Specifications and plans may be seen and blue prints of the plans and tender forms may be obtained on application to Walter J. R. Poole, clerk, 9, Dampier Street, Bridgwater, to whom sealed tenders must be sent not later than noon on June 18, marked "Tenders for Greylake's Fosse Bridge."

June 18. Banbridge.—Construction and erection of a steel umbrella roof, 35ft. by 22ft., at Banbridge, for the Great Northern Railway Co. (Ireland). Parties wishing to tender may see the drawing and specification at the office of W. H. Mills, engineer-in-chief, Amiens Street, Dublin; or copies of them at the Offices of the District Engineer, Belfast; and can obtain at the said offices lithographed copies of the drawing, specification and form of tender on payment of 10s. (not returnable) per set. Tenders, made out on the forms supplied by the Company, and endorsed "Tender for Umbrella Roof," should be delivered to T. Morrison, secy., Secretary's Office, Amiens Street Terminus, Dublin, not later than 10 a.m. on June 18.

June 23. Guildford.—Construction of a reservoir in ferro-concrete on the Hennebique system, the supply and erection of windmill and gas plant for pumping purposes, and the erection of certain brick and tile buildings on the site of the high service reservoirs situated 360ft. above Ordnance datum. Plans and sections may be seen and copies of the specification, bills of quantities, and form of tender obtained on application to C. G. Mason, A.M.I.C.E., borough engineer and surveyor, upon payment of £3 3s. Sealed tenders, endorsed "Tender for Works of Water Supply, Higher Levels," are to be sent to F. S. Miller, town clerk, Town Clerk's Office, Bridge Street, Guildford, on or before noon on June 23.

June 25. Hornsea.—Construction of a concrete sea-wall, promenade and groynes upon or adjacent to the foreshore at Hornsea, in the county of York, for the U.D.C. Contract drawing, terms and conditions of contract and specification may be seen on application at the office of the Clerk at Hornsea, or to the Consulting Engineer to the Council, W. T. Douglass, 15, Victoria Street, Westminster, London, S.W., on and after June 11. Copies of the form of tender, conditions of contract, and bills of quantities may be obtained upon application to the Consulting Engineer upon payment of a deposit of £2 2s. Copies of the drawings may be obtained from the Consulting Engineer on payment of 10s. 6d., which sum is non-returnable. Sealed tenders, which will only be received upon the forms supplied, endorsed "Tender for Sea Defence Works," to be delivered to T. Hornsey, at the Public Rooms, Hornsea, at or before noon on June 25.

June 30. Leicester.—Construction and erection of a steel bridge over the River Trent, together with the cast-iron cylinders and all dredging, excavating, bricklaying, and masons' work in the abutments and hauling path belonging thereto, in connection with Section No. 2 of the main for bringing the Derwent supply to Leicester. The bridge will be in one span of the bowstring type, supported on four cast-iron cylinders, and having a clear opening of about 220ft. between the cylinders and a width between the centres of the main arches of 10ft., and is estimated to weigh about 393 tons, including the cast-iron and steel work in the cylinders and hauling path. The drawings may be inspected at the offices of the engineers, Everard, Son & Pick, 6, Millstone Lane, Leicester, and conditions of contract, specification, quantities and form of tender obtained from them upon payment of £5. Sealed tenders, upon the form supplied, addressed to the Chairman of the Water Committee, Town Hall, Leicester, are to be delivered not later than 10 a.m. on June 30, endorsed "Tender for Trent Bridge—Derwent Main."

June 30. Mansfield.—Sinking a well near Waterfield Farm, in the parish of Clipstone, 3½ miles from Mansfield. The well is to be 150ft. deep and 12ft. in diameter in the new red sandstone, and is to be lined in part with cast-iron tubing. The contractor is to provide temporary pumping plant, capable of raising 70,000 gallons of water per hour 150ft. high, or 1,680,000 gallons in 24 hours. In addition to the well-sinking, the contract will also include driving certain headings and putting down boreholes. The drawings and specification may be seen at the office of the engineers, G. & F. W. Hodson, Bank Chambers, Loughborough, and copy of the schedule of quantities and form of tender obtained on deposit of a cheque for £5 5s. Sealed tenders, endorsed "Tender for Clipstone Well," to be sent to J. Harrop White, town clerk, Mansfield, not later than June 30.

June 30. Cairo.—Supplies and works in connection with the water supply of Menouf, including engine-houses, pumping machinery, motors, conduits, and steel water tower and reservoir. Specifications, plans, &c., may be seen at the Ministry of the Interior, Cairo. Tenders will be received by the European Secretary of the Ministry of the Interior, Cairo, up to June 30.

Oct. 1. Bangkok (Siam).—Construction of a bridge, 260 metres long, over the Meram River. For particulars apply to the Siamese State Railways, Bangkok. Tenders to be in by Oct. 1.

IRON AND STEEL.

June 9. Guildford.—Supplying and erecting about 700ft. lineal of barbed wire fencing with iron standards on the Poyle Charity estate. All particulars can be obtained from William G. Lower, surveyor to the Estate Trustees, 12A, High Street, Guildford, to whom tenders are to be sent on or before June 9.

June 11. Rotterdam.—Supply of 300 cast-iron strut syphons for the municipality. Particulars of the contract may be obtained from the Burgomaster of Rotterdam. A copy of the conditions (in Dutch), together with drawings, may be seen at the Commercial Intelligence Branch of the Board of Trade, 73, Basinghall Street, London, E.C. Tenders to be sent into the municipality by June 11.

July 16. Johannesburg.—Supply of enamelled iron and brass licence plates and badges required by the Council for the year 1907. Sealed tenders, endorsed "Tender for Licence Plates and Badges 1907," will be received by the Town Clerk, Municipal Offices, Plein Square, Johannesburg, Transvaal, South Africa, not later than noon on July 16. Forms of tender, specifications, and blue prints may be obtained on application to the Council's agents in London, E. W. Carling & Co., St. Dunstan's Buildings, St. Dunstan's Hill.

PAINTING AND PLUMBING.

June 7. Carmarthen.—Painting, colouring, &c., at the following Council schools:—Llwynhendy, Philadelphia, St. Clears, Trelech Village, Bettws, Capel Isaac, Velingw, Five Roads. Specifications may be seen and full particulars obtained on application at the above-mentioned schools, or at the office of W. D. Jenkins, M.S.A., M.R.S.I., county education architect, Shire Hall, Carmarthen. Tenders, sealed and endorsed, to be delivered to J. W. Nicholas, County Education Offices, Carmarthen, on or before June 7.

June 8. Hull.—Painting required at Drypool bridge and North bridge. Forms of tender and other particulars may be obtained at the City Engineer's office. Tenders, endorsed "Tender for Painting Bridge," are to be addressed to the Chairman of the Bridges Committee, and delivered at the Town Clerk's office before 10 a.m. on June 8.

June 8. London.—General repairs and painting to the artisans' dwellings, Stoney Lane, for the Corporation, according to specification and other particulars to be seen at the office of the Engineer to the Corporation, Guildhall, where forms of tender may be obtained. Tenders, on the before-mentioned forms, must be addressed, Town Clerk, Public Health Department, Guildhall, E.C., endorsed "Artizans' Dwellings," and delivered at the office of the Hallkeeper, Guildhall, between 1 and 2 p.m. on June 8.

June 9. Aberdeen.—Lime-washing of courts and closes, of which a specification and list lie at the Sanitary Inspector's Office, 4½, Union Street, and which will be given out for perusal of intending offerers on application any day at 10 a.m. Tenders addressed to the Council, and endorsed "Tender for Lime-washing," to be lodged with the Sanitary Inspector on or before June 9. The work to be commenced on June 18, and finished by July 21.

June 9. Nottingham.—Outside painting proposed to be done to the gates and the lodges at the Waverley Street and Sherwood Street entrances to the Arboretum. Specifications, forms of tender, and bills of quantities may be obtained on application at the City Architect's Office on payment of a deposit of 10s. Tenders, endorsed "Tender for Painting Lodges, &c., Arboretum," to be addressed to Samuel G. Johnson, town clerk, and delivered at his office, the Guildhall, before noon on June 9. Fair wages clause.

June 12. London, W.—Cleaning, painting and distempering, &c., the interior of the infirmary buildings at Isleworth, for the Guardians of Brentford Union, in accordance with specification, which can be seen at the Union Offices, Isleworth, W. Tenders, endorsed "Painting Infirmary," must be delivered to William Stephens, clerk to the Guardians, not later than 4 p.m. on June 12.

June 12. London, W.C.—Preparing and painting the whole of the external ironwork, and for cleaning out and repairing all the gutters and stack pipes at the Receiving House for Children and Nurses' Home in Broad Street, W.C., for the Guardians of St. Giles-in-the-Fields, and St. George, Bloomsbury, in accordance with a specification to be obtained at the Guardians' Offices, 57, Broad Street, Bloomsbury, W.C., where tenders must be delivered on or before 10 a.m. on June 12.

June 12. London, S.E.—Repairing and painting the footbridge over the London, Brighton and South Coast Railway at Sydenham Park. Specifications may be seen and forms of tender obtained at the Town Hall (Surveyor's Department). The tenders must be on forms issued by the Council, enclosed in an envelope, sealed and endorsed, "Tender for Painting and Repairing Footbridge," and must be delivered by 4 p.m. on June 12, at the Town Hall, and placed in the box there provided for the purpose. The works must be proceeded with immediately on acceptance of tender and execution of contract, and the contractor must employ local labour as far as practicable in carrying out the work. Fair wages clause.

June 12. Dumfries.—Painters' work proposed to be executed at the County Buildings, Buccleuch Street. The specification of the work may be seen at the office of James Barbour & Bowie, architects. Tenders must be lodged with John Robson, county clerk, County Buildings, Dumfries, on or before June 12.

June 13. London, S.E.—Repairs and cleaning and painting works at the Park Fever Hospital, Hither Green, S.E., for the Metropolitan Asylums Board, in accordance with specification prepared by W. T. Hatch, M.I.C.E., M.I.M.E., engineer-in-chief. Specification, conditions of contract, bill of quantities and form of tender may be inspected at the office of the Board, Embankment, E.C.,

and bill of quantities and form of tender can be obtained upon payment of a deposit of £1. Tenders, addressed as noted on the form, must be delivered at the office of the Board not later than 10 a.m. on June 13.

June 13. Dartford.—Cleaning and painting works at Darent Asylum, Dartford, Kent, for the Metropolitan Asylums Board, in accordance with specification prepared by W. T. Hatch, M.I.C.E., M.I.M.E., engineer-in-chief. Specifications, conditions of contract and form of tender may be inspected at the office of the Board, Embankment, E.C., and can be obtained upon payment of a deposit of £1. Tenders, addressed as noted on the form, must be delivered at the office of the Board not later than 10 a.m. on June 13.

June 16. Southwam.—Painting and decorating the interior of the Wesleyan chapel, and for re-varnishing all the pews and other woodwork. Particulars may be had from J. Wadsworth, South View, Southwam. Sealed tenders to be sent to the Rev. E. Wright Adcock, 1, Savile Row, Halifax, on or before June 16.

June 18. Darlington.—Painting, distempering and whitewashing of the elementary schools during the midsummer holidays. Specifications and particulars may be obtained on application at the Education Offices, North Lodge. Tenders to be delivered at the Education Offices, marked "Tender," not later than 4 p.m. on June 18.

June 18. Portsmouth.—Painting and cleaning certain schools, in accordance with a specification prepared by the Surveyor. Form of tender and all information may be obtained from the surveyor, Mr. A. H. Bone, at his offices, Cambridge Junction, Portsmouth. Fair wages clause. Tenders should be delivered at the Education Committee's offices, Town Hall, Portsmouth, not later than 10 a.m. on June 18.

June 23. Dunham.—Painting Dunham Bridge above and below the roadway, together with the gatehouse and outbuildings, gates, fences, &c. The specification may be seen and a form of tender obtained upon application to Scorer and Gamble, Bank Street Chambers, Lincoln, to whom tenders are to be delivered not later than 10 a.m. on June 23.

No date. Gateshead.—Cleaning and painting of various schools during the summer vacation (August). Specification and other particulars may be had on application at the Education Offices.

ROADS AND CARTAGE.

June 9. Forres.—Laying concrete pavements and kerbs and granite crossings in High Street and Cumming Street. Specifications and schedules of quantities may be obtained from John Rankine, burgh surveyor, and offers lodged with R. Urquhart, junior, town clerk, Forres, on or before June 9.

June 9. Morriston.—Widening of Llanllienwen Road, near Ynisforgan, Morriston, for the Swansea R.D.C. Plans and specifications may be inspected on application to G. Powell Thomas, highway surveyor, Fforestfach, from whom any further particulars may be obtained. All tenders to be sent to Edward Harris clerk, District Council Offices, Alexandra Road, Swansea by June 9.

June 9. Leeds.—Paving and flagging of the following streets:—Argie Road, Barnborough Street, Raincliffe Grove, Raincliffe Street, Everleigh Street, Temple View Terrace, Everleigh Place, Everleigh Grove, Chantrell Grove and Chantrell Place. Plans and specifications may be seen at the City Engineer's Office, Municipal Buildings, Leeds. Tenders, on printed forms to be obtained at the Highways Office, must be sent to the Town Clerk's Office, on or before June 9, addressed to the Highways Committee, and endorsed "Tender for Private Street Work."

June 12. Hetton.—Road materials. Supply of 300 tons of rough slag, 1,200 of 2½in. machine-broken slag, 100 tons of 1in. machine-broken slag and 100 tons of ¾in. slag gravel, for the U.D.C. Further particulars, together with form of tender, which alone must be used, may be obtained from the Surveyor of the Council, John Harding, Hetton-le-Hole, R.S.O., to whom samples of slag proposed to be supplied are to be sent on or before 10 a.m. on June 12. Sealed tenders, endorsed "Tenders for Road Material," to be sent not later than 10 a.m. on June 12, to John George Baty, clerk to the Council, Houghton-le-Spring, R.S.O.

June 12. London, N.—Paving with wood blocks portions of the carriageways of High Street and Upper Street, Islington, N., and for removing the granite sets from portions of High Street and Upper Street and paving other roads, at present macadamized, with such sets. Conditions and specification may be seen and forms of tender and bills of quantities obtained upon application to the borough engineer, J. Batten Barber, at the Town Hall, Upper Street, N., on payment of £2 2s. Sealed tenders, endorsed "Tender for Wood and Granite Paving," must be received by W. F. Dewey, town clerk, Upper Street, Islington, N., not later than 4 p.m. on June 12.

June 12. Southampton.—Supplying a steam road-roller in accordance with specification and particulars which may be obtained upon application to J. A. Crowther, borough engineer. Tenders, endorsed "Tender for Road-roller," must be delivered at the Town Clerk's Office before 2 p.m. on June 12.

June 12. Tottenham.—Repair of the tar and asphalt paving throughout the U.D.C.'s district. Specifications and forms of tender can be obtained on application to W. H. Prescott, A.M.I.C.E., engineer to the Council, Council Buildings, The Green, Tottenham, any day during office hours. Persons tendering will be required to deposit with the treasurer, when handing in their tenders in a Bank of England note, or cash, the sum of £5 which will be forfeited by the person whose tender is accepted if the contract be not executed within seven days from the date he is informed it is ready for signature, otherwise it will be repaid. Fair wages clause. Sealed tenders on the form supplied, endorsed "Tender for Tar and Asphalt Paving Repairs," to be delivered to Edward Crowne, clerk of the Council, Tottenham, by noon on June 12.

June 12. Baildon.—Supply of 500 tons of 2½in. broken limestone, to be delivered at Baildon Station, for the U.D.C. Tenders, endorsed "Limestone," to be sent to J. Bentley, clerk to the Council, Baildon, on or before June 12.

June 13. Northfleet.—Supply of stone, &c., from July 1, 1906, to June 30, 1907, both inclusive, for the U.D.C., as follows:—Guernsey granite: Supply of 700 tons of Guernsey granite as per Guernsey State weighbridge certificate weight, broken to gauges of ½ins. and ¾ins., for metalling roads, to be delivered free of all canal, river and other dues and charges (except wharfage) on to such wharf within the district at such times and in such quantities as may be directed by the Surveyor, each consignment to be delivered as aforesaid within twenty-eight days after notice from the Surveyor. Cement: Supply of such quantity of cement at per ton from time to time as may be required by the Council, such cement to be delivered at such places within the populous portion of the district as may be directed by the Surveyor. Surface flints: Supply of 1,600 yds. of surface-picked flints for metalling roads, to be delivered at such places in the district and at such times as may be directed by the Surveyor, at per cub. yd. Thames ballast: Supply within five days after notice free of all canal, river and other dues and charges (except wharfage) on to such wharf within the district as may be directed barge freights of clean Thames ballast, at per cub. yd., the measurement being settled by the Surveyor. Kentish ragstone: Supply at per ton within five days after notice free of all charges except carriage to a railway station on the South Eastern and Chatham Railway to be named by the Surveyor, or alongside some wharf within the district of Northfleet, free of all canal, river and other dues and charges as may be directed, such quantity or quantities of selected best quality hard blue finely-crushed (½in. gauge) Kentish ragstone, as per sample, and good quality Kentish ragstone, broken to a 2½in. gauge, for metalling the roads as follows: when the stone is delivered by railway it shall be in consignments not exceeding 32 tons, and when such stone is delivered by river each consignment shall be not less than 60 tons or more than 110 tons. For every such consignment five days' notice will be given. Granite setts: Supply of 60 tons of granite setts, 4ins. by 4ins. by 6ins. to 10ins. long, delivered free of all canal, river, and other dues and charges (except wharfage) on to such wharf within the district within twenty-eight days after notice from the said Surveyor. Tenderers are to state in their tenders the name and locality of the quarries from which the setts are to be supplied, and to deposit a sample sett at the Surveyor's Office. Road-roller and scarifier: Supply and letting within seven days after notice of a 12½-ton steam-roller with scarifier, and, if required, a 10-ton steam-roller with scarifier, including in every case fuel, drivers' attendance, oil, tools, tines, and everything except water necessary for working the engines, including a capable person to manipulate the scarifier. The price shall be at the rate per day of nine hours during the time a 12½-ton roller is at work rolling, and at the rate per day of nine hours during the time a 10-ton roller is at work rolling, and at the rate per square yard for scarifying old Macadam roads. No forms of tender or contract can be supplied. The rate of wages paid by contractors and the conditions of labour observed by them will be taken into consideration. Tenders are to be sent to the Council Offices, The Hill, Northfleet, not later than 4 p.m., on June 13, marked "Tender for —."

June 13. Croydon.—Works of kerbing and paving in the parishes of Addington, Beddington, Coulsdon, Merton and Mitcham, and the Hamlet of Wallington, comprising about 9,900 lineal ft. of granite kerbing, 16,500 super yds. of concrete paving, and 21,500 super yds. of tar paving for the R.D.C. Plans may be inspected and forms of tender and a copy of the specification may be obtained from J. S. Killick, highway surveyor, Town Hall, Croydon, on payment of a deposit of £5. Tenders, on forms provided, to be delivered to E. J. Gowen, clerk to the Council, Town Hall, Croydon, on or before June 13.

June 18. Ely.—Broken granite. Supply and delivery at Ely railway station of 400 tons (more or less) of 1½in. Clea Hill, blue Guernsey, or Leicestershire granite (separate prices for machine and hand-broken to be quoted) and 100 tons (more or less) of best Clea Hill, blue Guernsey, or Leicestershire granite in clean screenings; 20 tons of 1½in. similar granite to Black Bank Railway Station, G.E.R.; also 190 tons of 1½in. similar granite (separate prices for machine and hand broken to be quoted) to be delivered by water and unloaded on the river bank in heaps at the under-mentioned places for the U.D.C.:—80 tons to Adelaide Bridge; 60 tons to Prickwillow Bridge; 10 tons to Burnt Fen Bank, between Prickwillow Bridge and Mr. John Sindall's house; 40 tons for Mile End Drive, to be delivered on Burnt Fen Bank and tipped into carts near Mr. John Sindall's house. All the above to be delivered at such times and in such quantities as the Council by their surveyor may from time to time appoint. Samples of each should be sent to William McKilvie at the City Surveyor's Office in Ely (carriage paid) previous to delivery of tender. Sealed tenders, endorsed "Tenders for Granite," to be delivered or sent by post so as to reach G. Martin Hall, clerk, Market Square, Ely, by June 18.

June 19. Brentford.—Supply of 150 yds of blue Guernsey granite hand broken to a gauge of 2in. Forms of tender (on which alone tenders will be received), together with specification and conditions, may be obtained on application, personally, to Nowell Parr, surveyor, at his office, Clifton House, Boston Road, Brentford, between 10 and 5. Tenders to be delivered (sealed) at the Clerk's Office, New Brentford, on or before June 19, not later than noon, marked "Tender for Granite."

June 27. Uxbridge.—Drainage, construction of manholes, levelling, kerbing, channelling, retaining walls, metalling, and other appurtenant works in the following roads, all situated in the parish of Yiewsley, Middlesex, close to West Drayton G.W.R. Station, for the U.D.C.:—Tavistock Road, Wimpole Road, Winnock Road, Dock Road, Padcroft Road, Fairfield Road. Drawings may be seen and specifications, bills of quantities, and forms of tender obtained at the office of the surveyor on a deposit of £5. Sealed tenders, endorsed "Yiewsley Works," must be delivered at the office of J. Freebairn Stow, engineer and surveyor, Surveyor's Office, Corn Exchange, Uxbridge, not later than 4 p.m. on June 27.

No date. Forehoe.—Supply of materials and team labour for the roads, for the R.D.C. Particulars and forms of tender may be obtained from W. Partridge Smith, clerk, Vicar Street, Wymondham.

SANITARY.

June 7. Cheadle.—Construction of about 400 lineal yds. of gin. and 317 lineal yds. 12in. earthenware pipe sewers, with manholes, &c., at Grove Lane, Cheadle Hulme, for the R.D.C. Plans and drawings may be seen, and copies of the specifications and bill of quantities obtained on application to E. Sykes, C.E., between 10 and 12 daily until the 31st May (Saturdays excepted), on deposit of £1 rs. Tenders, duly sealed, and endorsed "Tender for Sewers," may be addressed to Arthur Briggs, clerk to Cheadle and Gatley U.D.C., Council Offices, Cheadle, near Manchester, on or before June 7.

June 7. Blything.—Drainage works for the Guardians. Works required to be done in taking up the old drains, &c., and laying new system and other works in connection therewith at the Workhouse at Bulcamp, near Halesworth, according to plan and specification prepared by Henry J. Wright, M.S.A., architect and surveyor, Ipswich. Copies, plan and specifications may be seen at Clerk's Office, Bulcamp, any week-day except Saturdays between 10 and 4, and on Saturdays between 10 and 2. Tenders, sealed and endorsed "Tenders for Drainage," to be delivered at the Clerk's Office, Union Workhouse, Bulcamp, Halesworth, not later than 5 p.m. on June 7.

June 7. Blaydon.—Scavenging, &c., for the U.D.C. Removal and disposal of scuttle ashes, contents of ashpits, house refuse, &c., at Blackhall Mill and New Chopwell. Specifications, form of tender, and full particulars may be obtained from Robert Biggins, sanitary inspector, at the offices of the Council, Blaydon-on-Tyne, between 9 and 10 a.m. Sealed tenders, endorsed "Tenders for Scavenging Contract," are to be delivered to Henry Dalton, clerk, Blaydon-on-Tyne, on or before noon on June 7.

June 9. Bolton-le-Sands.—Construction of a gin. iron and earthenware pipe sewer at Bolton-le-Sands, for the Lancaster R.D.C. Plans and specification may be seen and forms of tender obtained on application to W. Dixon, surveyor, 5, Dalton Square, Lancaster. Tenders to be delivered to W. D. Ball, clerk to the Council, 5, Dalton Square, Lancaster, not later than 10 a.m. on June 9.

June 12. Birmingham.—Reconstruction of the Washwood Heath and Salfley Outfall Sewers across the Birmingham Tame and Rea District Drainage Board's lands at Salfley, including alterations to the culverts under the Midland Railway and a crossing over the River Rea. The plans and specifications may be seen, and quantities and forms of tender obtained, on deposit of a sum of £2. Fair wages clause. Tenders, sealed and endorsed "Salfley Outfall Sewers," and addressed to the Chairman of the Public Works Committee, must be delivered at the office of T. Arnall, acting city surveyor, the Council House, Birmingham, on or before June 12.

June 13. London, S.E.—Construction of an underground convenience for women in Arnside Street, Walworth. Plans may be seen, and specification, conditions, and forms of tender and further particulars obtained between 10 a.m. and 5 p.m. on application to A. Harrison, M.I.C.E., borough engineer, Town Hall, Walworth Road, upon payment of a deposit of £1 rs. Fair wages clause. Tenders, which must be on the prescribed form, sealed and endorsed "Tender for Construction of Underground Convenience" must be sent to J. A. Johnson, town clerk, Town Hall, Walworth Road, S.E., not later than noon on June 13.

June 15. Uckfield.—Construction of the following works, for the R.D.C. About 19 miles of stoneware and iron sewers, ranging from 8ins. to 15ins. in diameter, with the necessary manholes, flushing tanks, &c.; purification works, consisting of covered settling tanks, double contact bacteria beds, storm-water beds, &c., and other works, in accordance with the specification and plans prepared by John Taylor, Sons, and Santo Crimp, civil engineers. Copies of the specification and quantities, with forms of tender, may be obtained from and the drawings inspected at, the offices of the Engineers, at Caxton House, Westminster, upon payment of £5 (cheque only). Tenders, endorsed "Crowborough Drainage—Contract No. 1," are to be delivered to Frederick Holman, clerk, 85, High Street, Lewes, on or before 10 a.m. on June 15.

June 19. London, E.—Cleansing and whitewashing the latrines and urinals at the various schools, for the East Ham Borough Council, as described in the form of tender. Specification and form of tender may be obtained at the Education Office, East Ham. The work must be done during the summer vacation. Each contractor must deposit £5 with his tender. Fair wages clause. Tenders, on the printed form, must be endorsed "Tender for Cleansing and Whitewashing," and delivered to H. C. Padgett, secty., Education Office, East Ham, E., not later than 4 p.m. on June 19.

No date. Long Eaton.—Forming, making sewerage, kerbing, channelling, &c., extensions of Breendon Street, Curzon Street, and Canal Street, on the estate of the Mutual Land Society according to the plans, specifications, and bills of quantities prepared for the above society by J. F. Dodd, surveyor, Long Eaton. Contractors desirous of tendering are requested to make application to Herbert W. Sunman, secty., "Ellerslie," Cleveland Avenue, Long Eaton, for copies of the said bills of quantities. Such application to be accompanied by a deposit of the sum of £2 2s.

TIMBER.

June 7. Penrhinwceiber.—Supply of the following timber for twelve months, for the Penrhinwceiber Navigation Colliery Co.:—Pitch-pine deals, red pine (best quality), American birch boards and deals, poplar and elm combs, elm, G. & T. match and flooring boards. Form of tender may be obtained on application to the Secretary. Tenders to be in by June 7.

June 12. London, W.—Supply of 100 fathoms of best Baltic board ends to be delivered cartage free at the Workhouse, Isleworth. Tenders, upon forms which may be obtained from William Stephens, clerk to the Guardians, Union Offices, Isleworth, W., must reach him before 4 p.m. on June 12.

June 12. Eton.—65 fathoms of best Swedish yellow deals and batten ends, for the Guardians. Price to include delivery early in the month of July next at the Workhouse at Slough, within one mile from the Grand Junction Canal and Great Western Railway Station. Tenders must be sent, endorsed "Tender for Timber," to R. H. Barrett, clerk to the Guardians, Slough, Bucks, before 10 a.m. on June 12.

MISCELLANEOUS.

June 7. Mallow.—Improvement of workhouse sewerage, painting of workhouse R.C. church, repairs to windows, and washing utensils in laundry, for the Guardians. Works to be carried out in accordance with specification of Clerk of Works. All tenders to be lodged with Maurio Regan, clerk, before noon on June 7.

June 8. Ashford.—Supply of the following articles for the schools for 12 months:—Ironmongery, electric-light fittings, brushes, &c., builders' materials, oilman's goods (paints, oils, &c.). Samples can be seen on applying to the Superintendent at the schools, between 10 a.m. and 4 p.m., and should be inspected. Tenders must be made upon forms which will be sent by F. G. Beeching, clerk to the managers, Ashford, Middlesex, on receipt of a stamped addressed foolscap envelope, and must be sent in by 11 a.m. on June 8.

June 9. Bilston.—Provision of furniture for Stonefield school. Forms of tender, specification, and schedule may be obtained from the architects, Baily & McConnell, Bridge Street, Walsall, on payment of a deposit of £1. All tenders must be endorsed "Tender for Stonefield Council School Furniture," and forwarded to F. M. Cooper, secty., Education Office, Town Hall, Bilston, not later than noon on June 9.

June 13, 14 and 15. Italy.—Supply of the following stores for the Italian Navy:—(1) varnishes to the estimated value of 29,700 lire (about £1,188); (2) colours (paint) to the estimated value of 25,800 lire (about £1,032); and (3) maple, walnut, elm, and other woods to the estimated value of 39,820 lire (about £1,593), delivery in each case to be at the Royal Arsenal at Spezia, Naples, Venice, and Taranto, as required. Deposits of 2,970 lire (£119), 2,580 lire (£103), and 3,980 lire (£159), respectively, will be required to qualify any tender. Tenders will be opened at 11 a.m. on the 13th, 15th and 16th, June for (1), (2) and (3) respectively. These competitions are on the "single auction" system. Sealed tenders for each of the above should be made out on Government stamped paper of one lira, which may be obtained from the Italian Consulate-General in London, 44, Finsbury Square, E.C. Local representation is necessary.

June 14. Oswestry.—Supply of the following stores for the Cambrian Railway Co., to be delivered in such quantities and at such times as may be required during the twelve months ending 30th June, 1907:—Brushes; bricks, drain pipes and lime; galvanised wire; iron tubes and fittings; fencing—wood; files, springs, spring steel, and buffer plungers; glass; iron and steel—bar and sheet pig iron; cement; bolts, nuts and chair spikes; lead (white and red); lead (sheet and piping); nails and crane chains; paints, turpentine, &c.; varnish and gold leaf; screws and washers; timber (English); timber (foreign); timber (foreign supplementary). The directors reserve the right of accepting any portion of a tender. Specifications and forms of tender may be obtained at the Stores Office, Cambrian Works, Oswestry, and specimens, patterns and samples may be seen there daily, except on Saturdays, from 9 to 4. Sealed tenders should be sent so as to reach C. S. Dennis, secty., Oswestry, not later than 9 a.m. on June 14, marked "Tender for —, No. —."

June 18. London, W.—Supply of the following stores for the Great Western Railway from July 2, 1906, to June 29, 1907:—Laminated springs; spiral and volute springs; tyres; straight axles; steel crankaxles and forgings for built-up cranks; iron bars; steel plates and sheets; steel bars and blooms; steel castings; iron forgings; chain and special iron for chain manufacture; tubes and fittings; cast-iron socket pipes; tool steel. Specifications and forms of tender (upon which alone tenders will be received) may be obtained on application to the Secretary, or to the Stores Superintendent at Swindon. Tenders addressed to G. K. Mills, secty., Paddington Station, London, and marked outside "Tender for Stores," will be received on or before June 18.

June 19. Dartford.—Supply and delivery of the undermentioned goods during the year ending June 30, 1907, for the U.D.C.:—Disinfectants; broken granite; electric meters; house cut-outs; house service cable, jointing material, and accessories for electric lighting department; general stores for electric lighting department. Particulars and forms of tenders will be sent to any applicant on receipt of a stamped addressed foolscap envelope, or may be obtained on application to the Clerk. No tender will be considered unless it be upon the prescribed form. Sealed tenders, in envelopes addressed "The Clerk, Urban District Council of Dartford, Council Offices, Dartford," and endorsed "Tender for —," as the case may be, must be sent in not later than 4 p.m. on June 19.

June 21. London, N.—Annual contracts for eight months from August 1, 1906 (except as regards item No. 10), which will be for eight months, one year and eight months, or two years and eight months, at the option of the Council:—(1) Providing and supplying horses, harness, and men for vans and watering roads of the borough (the Council supplying vans and water); (2) cartage and horse hire; (3) masons' and paviors' work; (4) supply of broken blue Guernsey, Enderby, Quenast and other granites, and granite chippings; (5) supply of ballast, crushed shingle, hoggins, hard core and flints; (6) supply of timber, &c.; (7) supply of wheels and tyres; (8) supply of manhole and other covers, gully grates, guard posts, castings, and other ironwork; (9) supply of iron, steel and tools; (10) works in connection with the construction and repairs of sewers and drains (the average amount of work executed under the contract during the last three years has been about £6,700 per annum). Form of tender and contract to be obtained on deposit of £5. Fair wages clause. Forms of tender and contract, and other particulars, may be obtained on application at the Town Hall, Upper Street, N., between 9 a.m. and 5 p.m. (except Saturdays). Tenders (properly endorsed) must be received not later than noon on June 21.

FIRE SUPPLEMENT (MONTHLY).

THE MILAN FIRE CONGRESS.

THE sequence of Congresses conducted under the auspices of the International Fire Service Council was continued last week at Milan, where there was a representative international gathering.

The city of Milan was selected on account of the International Exhibition which is being held at that city. The British Fire Prevention Committee took the opportunity of this Congress to again arrange for one of its special Commissions to visit the leading cities of the country in which the Congress was held, in order that a report may be issued as to the local fire-preventive arrangements. The Commission visited Rome, Florence and Venice prior to Milan. At the Congress the Commission was joined by other members of the Committee and a large party of fire-brigade officers under Colonel Fox.

The Congress meeting took place in the assembly room of the Permanent Art Exhibition, and was attended by about 500 delegates from all the European countries, many Government departments and municipalities being represented. There were four meetings, followed by the special meeting of the International Fire Service Council.

Among the papers read was one on "International Relations in the Fire Preventive and Fire Brigade Services," by Mr. Edwin O. Sachs, F.R.S.Ed.; one on "The Protection of Vertical Openings," by Mr. Ellis Marsland, district surveyor; one on "Reinforced Concrete as a Fire-resistant," by Mr. James Sheppard, A.I.E.E.; and one on "Fire Risks due to New Industries, and the Motor Industry in particular," by Mr. Percy Collins. We publish Mr. Marsland's paper in this issue.

Resolutions on Reinforced Concrete.

The subject of reinforced concrete is one to which the Congress accorded special attention, and the following resolution was unanimously carried and confirmed at the final meeting as one of the resolutions to be circularized among various Government departments concerned:—

"That the Congress considers that no reinforced concrete construction should be permissible in building intended to be fire-resisting unless the aggregate be most carefully selected and applied in such a manner as to give substantial protection to all metal parts.

"That it is advisable where reinforced concrete is intended to be fire-resisting that every portion of the metal rods or bars contained therein be covered by not less than zins. (5 c.m.) of concrete, the aggregate of which must be able to pass through a sieve of not more than rin. (2.5 c.m.) diameter, and that Portland cement of great fineness only be used.

"That where feasible all external angles should be rounded.

"That any angle iron needed for mechanical protection should be held in position independently of the concrete."

Whilst in Rome, the Special Commission of the British Fire Prevention Committee were received by the King of Italy; who accorded the members an audience of about half an hour, discussing various questions as to fire-protection with them. It may be remembered that in 1903 the Italian Government struck a special gold medal in recognition of the Committee's services, which medal was presented to the Committee as a token to be kept in its corporate capacity.

THE DIFFERENT SYSTEMS OF FIRE-RESISTING SHUTTERS, &c., IN USE TO PROTECT DOORS AND WINDOWS.*

By Ellis Marsland,
District Surveyor.

HOWEVER fire-resisting a building may be internally, unless it can resist fire from the outside it is as vulnerable as the most combustible building.

The protection of window openings to prevent the ingress of fire has not hitherto received the attention which the importance of the subject deserves, and your president has kindly asked me to contribute to this Congress a short paper dealing with the methods at present employed to attain this end; and although I cannot claim to demonstrate anything particularly new, yet I may be able to contribute the results of some valuable tests conducted by the British Fire Prevention Committee, and thus enable you to have a basis of fact upon which further improvements may result.

The fire service of the world learned a great number of lessons from the Baltimore fire, but none was so apparent as the necessity for this exterior protection.

The following are the methods usually employed in the protection of window openings:—

- I. By wrought-iron shutters.
- II. By tin-lined wooden shutters or shutters of flameproof wood.
- III. By steel revolving shutters.
- IV. By asbestos cloth blinds.
- V. By wired glass or Luxfer prisms fixed in hardwood or iron frames.

I. Wrought-iron Shutters.

These are usually hung folding on the outer face of the window opening to angle iron frames; they are folded back against the wall similar to sun shutter when not in use. The thickness of the shutters varies according to the size, but it should not be less than ¼ in. (.0063 m.) in the panel, with styles and rails of the same thickness. The disadvantage of this form of protection is their weight and the difficulty of readily closing them on an emergency; added to this is their appearance from an architectural point of view; otherwise, if their services are once brought into play, they make an efficient fire-stop.

II. Tin-lined Wooden Shutters or Shutters of Flameproof Wood.

These, as in the former instance, are usually hung folding on hook and eye strap hinges and overlap the opening some 3 ins. (.076 m.). They are usually 1½ ins. to 2 ins. (.038 m. to .051 m.) thick, of pine in two or three thicknesses nailed or screwed together and overlaid on both sides and edges with tin plates, the joints being lap welded. There has been an improvement upon this construction by the introduction of flameproof wood in the interior and by sheets of asbestos board or Uralite being placed between the thicknesses. This gives increased protection and staying power to the shutter, but this class of shutter is open to the same objection as the iron

* Presented at the International Fire Service Congress at Milan.

shutter, viz., the difficulty of readily closing them on an emergency. There is also the architectural disfigurement of the building, and another disadvantage in a long sustained fire, the gases generated by the combustion of the wooden interior of the shutters escaping through the joints of the tin encasement and becoming ignited, eventually accelerating what it was designed to retard. My own opinion is that shutters of this character are equally effective constructed of flameproof wood alone without any tin-lining, as they would resist the spread of fire equally well, but their thickness should not be less than zins. (.05 m.).

III. Steel Revolving Shutters.

This is a type of window-protection usually used as a means of protection apart from fire, but it may be used in a dual capacity and is efficient in many respects provided the laths or strips are of the interlocking or hinged principle, with special provision to allow of expansion and contraction at all points. It is not open to all the objections of the two former systems, yet it has its disadvantages. The heat soon radiates through the thin steel, and unless the water from the fire hose is available for keeping it cool the radiated heat soon carbonizes the adjacent woodwork and cracks the window glass.

The shutters require a fairly deep steel groove or runner with slotted holes to take the fixing bolts; the revolving gear can be fixed within the depth of the opening and be made no more objectionable from an architectural point of view than an ordinary sun blind. They are not open to the objection of difficulty in manipulation, as it is possible to lower them from the inside, or they may be made to work automatically. Their cost is somewhat heavy, but if this is no impediment the steel revolving shutter is perhaps a fairly satisfactory means of protecting an opening.

IV. The Asbestos Cloth Blind.

This means of protection has all the advantages of the steel revolving shutter without its disadvantages. It can be rolled up as an ordinary sun blind on a spring roller and can be manipulated from the inside by means of a steel or copper cord. The blind requires a flexible incombustible cord bound to the edges, and small steel or copper rods extended across the blind and fixed thereto about every 7 ins. (.2 m.) to prevent the blind bellying inwards or outwards, and it must also travel in a runner at least 1½ ins. (.04 m.) deep. A somewhat heavy steel or copper lath is required to be secured to the bottom of the blind so that it may sit closely on the window sill to prevent flame lapping beneath.

The material is, however, somewhat fragile and liable to damage by falling materials and the force of the water jet, and the radiation of heat through the material, although not so great as in the case of steel shutters, is considerable.

V. Wired Glass and Electro-glazing.

One of the chief objections from a fireman's point of view to all the foregoing systems is that when the shutters are closed,

and thus fulfilling their purpose, a fire may assume considerable proportions within a building without being observed.

This objection cannot be raised to wired glass and electro-glazing, and they have the following advantages:—They are always in their place ready for duty; they form part of the building, and are no architectural disfigurement, and their cost is not prohibitive.

I am of opinion we have in these materials two of great promise, but the great point is how are they to be fixed.

My own view is that wired glass must not be in substitution for the ordinary window glass (except it is used as the outer casement where double casements are required) but in addition thereto, as there is considerable radiation of heat through it, and it should be glazed into metal frames, and each square of glass should not exceed 100 sq. ins. (.065 m.). Putty should not be used, but it should be secured into the frames by a metal fillet, and a strip of some soft incombustible material such as slag wool or asbestos placed around to act as a cushion to allow for expansion and contraction.

This system is of course only available up to the melting point of glass, but in actual practice it is only in exceptional cases this point is exceeded on the outside of a building, and as the material will allow water to be poured upon it without disintegrating it is a fairly reliable material for window-protection.

The electro system of glazing is akin to the above, and has the additional advantage that it does not obstruct the vision as does the wired glass, as the squares are each 16 sq. ins. (.01 m.) in area, and it offers the same resistance to the passage of flame as does the wired glass.

Doors.

Coming now to the protection of door-openings. The British Fire Prevention Committee has made an extensive series of tests with wooden doors, both hard and soft, including deal, pitch-pine, poplar, mahogany, walnut, oak, teak, jarrah and karri, with a view to discover their actual and relative fire-resistance.

The doors were made of a uniform size, 3ft. 6ins. by 7ft. (1'067 m. by 2'133 m.). The thickness of the doors was 2ins. (.05 m.), and they were framed together with four solid panels and hung to solid frames of the respective materials of which the doors were constructed.

These doors were only intended to give temporary protection, and those made from oak, teak, jarrah and karri gave the best results and endured for about sixty minutes. It was found that their resistance to fire depended largely on the care with which they were fitted, as any space between the door and frame through which a draught was created was followed by smoke and eventually by flame and the door was destroyed.

Doors of this character are suitable for the outer door of tenement buildings on to main staircases; they would not be of much service as a fire-stop in warehouses, but would be useful in retarding a fire and allowing employees to escape.

Tin-lined Wooden Doors.

Wooden doors made of three thicknesses of pine lined on both sides and edges with tin are often used to close openings in warehouse walls. These are usually made without frames, and overlap the openings 3ins. (.077 m.) at the sides and top, and are made either to slide or hung with strap hinges, but in a fire lasting any considerable time the wood carbonizes, the gases escaping from between the joints of the tin ignite and the door eventually collapses.

Greater staying power is obtained if the wood interior is made non-flammable and the thicknesses are divided by asbestos board or Uralite, but this adds materially to their cost.

They give at best only partial protection, and cannot be trusted in an extensive conflagration.

The British Fire Prevention Committee has made from time to time a series of tests with doors of this character variously constructed, but an hour and a half for a single door is about the limit of their fire-resistance.

Iron Doors.

To reduce the danger from fire in warehouses, buildings of this character are required by the London Building Act to be divided by walls into compartments of 250,000 cub. ft. (7,200 m.c.). Openings may be made in the division walls not larger than 7ft. wide and 8ft. high (2'13 m. by 2'44 m.). These doors are required to be of iron, and either hung with hinges to iron rebated frames or made to slide on runners. The doors that are made to hang on hinges are, if exceeding 3ft. 6ins. (1 m.), usually hung in two leaves. The thickness of metal required is $\frac{1}{4}$ in. (.006 m.) in the panel, with styles and rails of the same thickness.

It has been found in practice that unless these doors have at least three hinges and bolts at the top bottom and middle, they buckle and twist and let the fire through. Two doors are required to each opening, with the full thickness of the wall between, without woodwork of any kind.

It has been found in practice that this arrangement answers fairly well where the doors are only 3ft. 6ins. wide, but they require to be proportionately thicker as the size is increased.

Revolving Steel Shutters.

This class of shutter is also available for closing openings in warehouse buildings, but their substance being comparatively thin, there should be two to each opening with as wide a space between them as possible, and the runners or grooves in which they slide should be formed of angle iron at least 2ins. (.05 m.) in depth and slotted for contraction and expansion. The laths forming the shutters should be of the interlocking principle, at least $\frac{1}{8}$ in. thick (.0015 m.). The British Fire Prevention Committee have tested shutters of this description with satisfactory results so far as keeping back flame and retaining their position, but there was a great deal of radiated heat through the shutters, which defect might be minimized by arranging a series of sprinkler heads between the doors or on one side, but there is no question that doors of this description are capable of remaining in position and preventing the spread of flame and also withstanding the water jet at considerable pressure. The projection of the hood, however, is liable to be damaged by falling materials, which may render them inefficient at a critical moment.

Composite Doors of Concrete and Steel.

All descriptions of iron doors are open to objection by reason of the radiation of heat through them, but the door constructed of iron and concrete is one of which I have hopes of a satisfactory result. The British Fire Prevention Committee have not had any doors coming under this description under test, but at a large fire in Glasgow doors of this character came well out of the ordeal. They were constructed of T-iron frames with flat bar bracing fixed to the web of the T-iron, and wirework netting was affixed thereto. The whole space between the T-iron was filled with fine concrete composed of either clinker or coke-breeze.

Doors of this character would be useful in warehouses, as the radiation of heat would not be so great as with iron doors. I am, however, of opinion that if the T could be constructed with aluminium it would be an advantage both from the point of weight and expansion.

These, I think, exhaust the materials at present at our disposal.

CONCRETE.

The Effect of Heat upon its Crushing Strength and Elastic Properties.

By Prof. IRA H. WOOLSON.

IT is well known that concrete in building construction will withstand the attack of a fierce conflagration for some hours and retain its stability of form and strength. This has been proved by actual fires in buildings and repeated severe fire tests upon full-sized floor units and partitions. It is also well known that concrete constructions have occasionally failed during conflagration and during official fire tests being made to determine the efficiency of some particular method of reinforcement. The causes of these failures were not always well defined. Usually they have been directly traceable to defective metal protection, unwise design of structural parts, or to the fact that the concrete was too green when subjected to the test. In some cases, however, the cause of failure was not entirely clear, and much speculation has been rife as to just what degree of heat a concrete would stand before its strength and elasticity would be affected.

Objects of Fire Tests.

The fire tests of reinforced concrete, such as have been conducted by the British Fire Prevention Committee in London and by the writer in co-operation with the Bureau of Buildings in New York City and elsewhere, have for their purpose the determination of three properties: first, effect of a continuous fire at 1,700 degs. or 2,000 degs. Fahr. for three or four hours; second, effect of the application of a long stream of water at short range while the material is still at a high temperature; third, amount of deflection due to a load during the fire, and subsequent increased loading to 600 lbs. per sq. ft. after the structure has cooled. The methods of construction and character of test are regulated by municipal specifications in this country, and by the standards of the British Fire Prevention Committee in England.

Concretes Used.

The concretes used have included trap, limestone and cinder,* and were usually 1-2-4 or 1-2-5 mixtures. The reports of numerous tests of this character were examined, and in most instances the concrete stood the heat and subsequent loading well, but the results were general and referred to the quality or resistance of a particular construction rather than to specific data regarding the concrete itself. Large numbers of tests of compressive strength and elastic properties have been made upon concrete of various composition and after different preliminary treatments, but no records were found in which the concrete was heated prior to testing.

U.S. Arsenal Tests.

The report of the U.S. Arsenal at Watertown, Mass., for 1902 contains data of tests of neat cement cubes of several brands which were heated before crushing. A synopsis and discussion of these is given by James E. Howard in the May, 1905, issue of "Cement," and some of his conclusions are given, since it is fair to assume that the action of neat cement under heat should be at least a slight criterion of that of concrete. Table I. is a summary of the results reported by Mr. Howard.

Since all the factors which enter the concrete problem are variables, it is extremely difficult to arrive at even a partial solution under any one set of conditions. There is, first, variation in the quality of the cement;

* [The definition of cinder used in the United States would be desirable. We assume the equivalent is clinker.—Ed. B.J.]

second, difference in size, sharpness and cleanliness of the sand; third, size and quality of the stone, gravel, slag or cinders used; fourth, variations in the proportions of the three solid ingredients and the amount of water used; and, fifth, method of mixing and treatment after moulding, including age

heated; then three cubes and two prisms of each composition were tested at each temperature.

Method of Heating.

The heating to 1,750 degs. Fahr. was done in an oven type of gas furnace. The furnace had a capacity of twelve cubes or two prisms,

applied faster than the concrete will adjust itself to the new stresses, or a fictitious strength will be recorded and instrument readings will alter until an equilibrium has been established. Compressions were measured at loads of 0 lbs., 25 lbs., 50 lbs. and 100 lbs. per sq. in., and then by increments of 200 lbs. per sq. in., until indications of failure forced the removal of the instrument. Sets were measured one minute after the removal of each load, this interval being found sufficient to allow the specimen to assume a stable condition.

It was originally intended to have the concrete at least sixty days old before testing, but owing to an unavoidable delay in securing part of the material it became necessary to test the specimens when a little over a month old. This was much to the disadvantage of the concrete in the fire tests, and it also accounts for the rather low values obtained in the tests of unheated specimens.

Results.

Table II. gives the ultimate crushing strength of the 4in. trap cubes which were heated to various temperatures and crushed after cooling. No appreciable effect upon the strength can be noted until a temperature of 750 degs. is reached. This gave slightly lower average strengths. Beyond 750 degs. the decrease was marked, though there were two or three exceptions to the rule notable at 1,500 degs., where two of the specimens gave remarkably high results. Why these cubes should have withstood the heat so much better than the others is not known. With the above exception, the surface of all specimens heated over 750 degs. was covered with minute cracks. At 2,250 degs. Fahr. the cubes were slightly fused, due to the fact that firebrick protection was displaced in removing previous specimens, and the remainder were more or less exposed to direct contact with the flames.

Table III. gives similar data for the limestone cubes. The three unheated cubes show an average strength only slightly inferior to that of the trap mixture. Heating to 500 degs., however, gave a great loss in strength. There were no evidences in the appearance of the cubes indicating this

* Cubes set in air.

† Cubes set in water.

It was desired to ascertain the effect of elevation of temperature alone without introducing internal strains incident to a state of unequal temperatures in different parts of the specimen. The test pieces were 4in. cubes cast slightly more than a year previous. Tests were at intervals of from four days to four months after heating. The cubes were gradually raised to the recorded temperatures. The heating took one hour, the maximum temperature was held one hour, and the specimens were then allowed to cool slowly in dry sawdust or powdered asbestos. During the heating the specimens developed fine cracks; these were hardly visible immediately after cooling, nor were they one day later. Four days after heating they were generally developed and at eleven days they were nearly at a maximum. The effect upon the crushing strength was not serious when the cracks were fine, as the parts fitted together under pressure.

Table I. shows the variation in ultimate crushing strength of the cubes. Each result is an average of three tests. This indicates that there is no decrease in strength up to a temperature of 600 degs. Fahr., but for higher temperatures the strength diminishes quite rapidly.

before testing. This latter is quite important, for it is well known that the strength of concrete increases rapidly for a period of six to twelve months after casting, and continues to increase slightly up to two or more years.

It was decided to make the concrete a 1-2-4 mixture of cement, sand and 3/4 in. broken stone, this being a common mixture used in constructing reinforced concrete floors. The cement consisted of a mixture of different brands of the best grades of Portland. The sand was taken from a quantity being used in the erection of a new building on the University grounds. It was of medium size (90 per cent. passing a 12-mesh sieve), fair quality, and not especially clean. Two varieties of stone were employed—Hudson River blue limestone and Hudson River trap-rock. Two sets of specimens were prepared, which were duplicates in every respect except that one contained limestone and the other trap-rock. A moderately wet mixture was used, tamping in the moulds being continued until the surface of the concrete became flushed with water.

Heat Employed.

The investigation had three primary objects: first, to ascertain at what temperature the concrete began to lose crushing strength due to heat treatment; second, the rate at which strength decreased as a result of increase of heat; and last, but not least, the effect of varying temperatures upon the elastic properties of the concrete: the purpose being to determine if the elasticity began to diminish prior to the strength or concurrently with it. It was decided to make 500 degs. Fahr. the initial heat, and then to increase the temperature by intervals of 250 degs. Fahr. to 2,250 degs. Fahr., testing specimens at each temperature. The upper temperature limit was well above the average of a burning building, which is conservatively estimated by most experts as from 1,500 degs. Fahr. to 2,000 degs. Fahr.

The determinations of crushing strengths were made upon 4in. cubes; for the elastic properties prisms 6ins. by 6ins. by 14ins. were used, the height being sufficient to allow the measuring of compression on a length of 12ins., and the cross-section being large enough to avoid the necessity of considering the specimen as a column.

To establish the quality of the concrete three cubes and three prisms of each composition were first tested without being

and also allowed room for protecting them from the flames with firebricks placed around the sides and top. The specimens were kept from contact with the floor by being supported on iron rods. Above 1,750 degs. Fahr. the heating was done in a large gas crucible furnace. To ensure equal heating throughout the specimen, the rate of heating was arbitrarily fixed at forty-five minutes to reach the first 500 degs., and thirty minutes for each successive 250 degs., the maximum heat being held ten minutes before removing the specimen. This method subjected the prisms to a shorter period of heating than the cubes for every temperature except 500 degs., because the former were brought to the required temperature, held there and then removed. The latter were charged into the furnace twelve at a time, brought to the proper heat, held there ten minutes and three cubes removed; then the temperature was raised 250 degs., and held again. This being continued until the last cubes were removed. Good results were obtained for the cubes for all temperatures, but it is doubtful if the prisms were uniformly heated at temperatures under 1,250 degs., as will be explained later.

Temperatures were measured continuously by a Le Chatelier pyrometer. The thermocouple was located about 4ins. above the floor of the furnace and closely surrounded by the specimens.

After heating, the specimens were immediately removed from the furnace and allowed to cool in the air. The testing was done at intervals up to three weeks subsequent to the heating.

Method of Testing.

The tests were made upon a Riehle testing machine of 100,000 lbs. capacity. The cubes were faced on the upper surface with plaster-of-Paris, the lower face being in all cases smooth enough to require only a few sheets of blotting paper to ensure a firm bearing. The pressure was applied to the top and bottom faces as determined by their position in the mould. The pressure was applied very slowly and steadily until the specimen failed.

The prisms were faced on both ends with plaster and compressions measured on a gauged length of 12ins. by an electric contact extensometer adjusted to the specimen as shown in Fig. 1. The load was applied at the same rate as for the cubes. It is important that the load should not be

FIG. 2.—APPEARANCE OF 4-IN. CUBES OF LIMESTONE CONCRETE THREE DAYS AFTER HEATING TO TEMPERATURE OF 2,000—2,250 DEGS. FAHR.

FIG. 3.—TYPICAL CURVES OF TRAP CONCRETE.

deterioration. No further weakness resulted at a temperature of 750 degs., but beyond this the loss of strength continued. After heating to 2,000 degs. and 2,250 degs. the cubes appeared strong and in good condition while hot, but when cold they began to disintegrate, and at the end of three days their appearance was as shown in Fig. 2. No attempt was made to test these specimens.

Table IV. contains the results of the test upon the elastic properties of trap-rock prisms. Three curves were also plotted for each specimen: (1) total deformation, (2) set, and (3) true elastic. The latter was obtained by Professor Bach's method, viz., by subtracting from each total deformation reading the corresponding set reading. Modulus of elasticity (E) was figured for three points of the true elastic curve.

Taking the age into consideration, the values for the unheated specimens compare favourably with the results of other investigators. As is usual, the value of E diminishes with increase of pressure. With the heated specimens this is not so marked; in fact, it is often the reverse, particularly with the intermediate loading. There is, however, a very marked decrease in the value of E due to the heating. This change becomes very apparent even with a temperature of 500 degs. and the value gradually decreases with the increase of heat. There were some erratic results, but later investigation makes it quite certain they were due to imperfect heating.

After the elastic measurements on the prisms were completed the extensometer was removed and the specimen loaded to failure. The ultimate crushing strengths which were thus obtained are given.

Table V. gives the same data for limestone prisms. The moduli for the unheated specimens are about the same as those obtained by the writer on a series of similar tests recorded in "Engineering News" of June 1st, 1905, the average value of E obtained there being approximately 3,600,000 for a sand-limestone concrete fifty-five to fifty-eight days old, and the average here found being 3,300,000 for prisms twenty days younger of like composition.

The value of E falls rapidly with increase of heat applied, the same as for the trap-rock mixture.

The surfaces of the prisms of both mixtures were covered with minute cracks after being subjected to over 750 degs. and then cooled. These cracks increased in number and size as the heat became higher, and at 1,500 degs. the prisms began to warp and disintegrate on cooling. This deterioration increased with time, and at the end of nine days one prism of each mixture was so badly crumbled that it was unfit for test. The others were very much weakened. This disintegrating effect is probably due to the swelling of the cement as a result of recalcination.

The curves of all the heated specimens

FIG. 5.—ELASTIC CURVES OF ALL PRISMS OF TRAP CONCRETE.

FIG. 4.—TYPICAL CURVES OF LIMESTONE CONCRETE.

Figs. 3 and 4: Typical Stress-strain Curves of Normal Concrete and Concrete previously exposed to temperatures of 1,000 degs. Fahr. and 1,500 degs. Fahr.

[Full lines give total deformation. Dotted lines give sets. Dot-and-dash lines give true elastic deformation = total deformation minus set.]

General Note to Figs. 3, 4, 5 and 6:—Test pieces 6ins. by 6ins. by 14ins. high, of 1:2:4 concrete. Compressions measured on 12in. length. Test pieces heated at ages of thirty-three to fifty-seven days, then cooled slow and tested three to nineteen days later.

FIG. 6.—ELASTIC CURVES OF ALL PRISMS OF LIMESTONE CONCRETE.

Figs. 5 and 6: Elastic Curves of Normal Concrete and Concrete previously exposed to various temperatures from 500 degs. Fahr. to 1,500 degs. Fahr.

[Two specimens tested for each temperature. All curves give true elastic deformation = total deformation minus set.]

FIG. 7.—CURVE OF CRUSHING STRENGTH.

Figs. 7 and 8: Variation of Crushing Strength and Elasticity of Concrete with temperature of previous heat exposure. [Test pieces 4in. cubes, 6ins. by 6ins. by 14ins. prisms.] Curves of Elasticity give the modulus at limit stress of 200 lbs. per sq. in.]

FIG. 8.—CURVE OF MODULUS OF ELASTICITY.

show a large deformation in the early part of the test when the loads were comparatively light. This gradually lessens as the loads increase and the middle portion of each curve approaches a straight line and then falls off again when ultimate failure begins. The large deformation at first is doubtless due to the closing up of the numerous fire cracks previously mentioned.

A peculiar characteristic of many set curves for both mixtures is the tendency they have to reverse direction and go back towards the axis. A conspicuous example appears in Fig. 4. No satisfactory explanation for this behaviour has been suggested.

It will be noted that the elasticity of the specimens decreased rapidly with the increase of heat. This is clearly shown in Figs. 3 and 4, where all three curves for each test of three typical specimens of each mixture are plotted to the same scale, showing the character of the total deformation, set and elastic curves without heating, and the corresponding curves for specimens which had been heated to 1,000 degs. and 1,500 degs. Fahr. respectively.

The "true elastic" curves of all the prisms tested are grouped in Figs. 5 and 6, which indicate very plainly the gradual decrease of elasticity due to heating of the concrete.

The gradual decrease in strength of both cubes and prisms due to heat treatment is shown by the curves in Fig. 7. In general, the trap-rock mixtures were the stronger. There were some irregularities, which undoubtedly resulted from defective heating. Fig. 8 shows graphically the drop in the value of E for both mixtures due to heating.

As stated, the length of time a specimen should remain in the furnace to bring it to a certain heat was fixed beforehand, and with the 4in. cubes the rate of heating employed appeared to give them uniform treatment throughout.

It was supposed that the prisms would heat uniformly also in the time allowed, but subsequent results raised doubts regarding this. However, owing to the delays previously mentioned it was too late in the season to duplicate the specimens and get them tested this spring, so the tests were completed and this report is rendered upon data obtained.

Table VI. gives the actual times of heating for each class of specimen. It is known now that the time allowed for the prisms was not nearly sufficient to ensure uniform temperature throughout. This is particularly true for the low temperatures. With the high temperatures the variation was probably not so great.

TABLE VI.—PERIOD OF HEATING THE TEST SPECIMENS.

Specimen	Heated to degrees Fahr.	Time.	
		hours	mins.

Prisms	500		55
"	750	1	55
"	1000	1	55
"	1250	2	25
"	1500	2	55

A test was recently made of the conductivity of the concrete in the prisms under the conditions of heating employed in the tests, and it was found that by allowing 1 hour 15 minutes to bring the furnace temperature up to 750 degs. Fahr., and then holding that temperature constant, it required 2 hours 40 minutes more for the interior of two different prisms to attain the same temperature. Then rising the furnace temperature to 1,000 degs. in 30 minutes, it required 1 hour 10 minutes more for the prisms to become uniformly heated throughout. The tests were made by embedding thermo-couples in the middle of the prisms, and connecting them by switch to the same galvanometer on which the couple in the furnace was recording. The concrete on which this test was made was twenty-eight days old. In this instance it required 5 hours 35 minutes to obtain a temperature of 1,000 degs. Fahr. through 3ins. of concrete where the specimen was surrounded by heat on all sides, with no radiation possible.

1. The Advantage of Low Conductivity.

This last experiment proved that the concrete had a very low conductivity and made certain the fact that the prisms tested had not been heated throughout to the temperature with which they are credited. At the same time, the writer believes, it explains the apparent discrepancy which exists between the results of these tests and some very satisfactory fire tests which have been made upon full-sized floor constructions. In a test of the latter character the fire is applied to one side only, and, although a heat of 1,700 to 2,000 degs. is maintained for four hours, the concrete is such a poor conductor of heat that only a small portion of it ever reaches a temperature which would cause it to deteriorate to any great extent.

UNIFORM BY-LAWS.

Recommendations of the National Board of Fire Underwriters for the Construction of Fireproof Buildings.

(Concluded from p. 32, No. 583.)

Encasing Exposed Sides and Bottom and Top Plates and Flanges of Girders and Beams.

The exposed sides of wrought-iron or rolled steel girders supporting walls, iron or steel floor beams, or supporting floor arches or floors, shall be entirely encased with hard-burned clay, porous terra-cotta, concrete or other fireproof material not less than 4ins. in thickness, and the bottom and top plates and flanges of such girders shall have not less than 2ins. in thickness of such insulating material.

The bottom and top plates and flanges of all wrought-iron or rolled steel floor and roof beams, and all exposed portions of such beams below the abutments of floor arches or filling between the floor beams, shall be entirely encased with hard-burned clay, porous terra-cotta, concrete or other fireproof material, such encasing material to be not less than 2ins. in thickness.

All encasing material to be securely attached to the girders and beams.

The shells and webs of hollow tile blocks shall be not less than 1in. in thickness, and shall be laid up with Portland-cement mortar, and the said blocks be suitably tied or anchored together.

Encasing Interior Columns and Girders in Non-Fireproof Buildings.

In all non-fireproof buildings where iron or steel structural members are incorporated in the construction of the building, said iron or steel columns, girders, beams and other structural metal members shall be encased as before described in this section, except that the thickness of such insulating material may be not less than 2ins.

Skeleton-Constructed Buildings.

Where columns are used to support iron or steel girders carrying enclosure walls, the said columns shall be of cast-iron, wrought-iron or rolled steel, and on their exposed surfaces be constructed to resist fire by having a casing of brickwork not less than 8ins. in thickness on the outside surfaces nor less than 4ins. in thickness on the inside surfaces, and all bonded into the brickwork of the enclosure walls.

The exposed sides of the wrought-iron or steel girders shall be similarly covered in with brickwork not less than 4ins. in thickness on the outer surfaces, and tied and bonded, but the extreme outer edge of the flanges of beams or plates or angles connected to the beams may project to within 2ins. of the outside surface of the brick casing.

The inside surfaces of girders may be similarly covered with brickwork, or if projecting inside of the wall they shall be protected by terra-cotta, concrete or other fireproof material not less than 4ins. in thickness.

Girders for the support of the enclosure walls shall be placed at the floor line of each storey.

The skeleton steel frame of a building shall be independent from that of an adjoining building, and the frame of one building shall not be bolted or riveted in any manner to the frame of any other building.

Reinforced Concrete or Concrete-Sleeve Constructed Buildings.

The term "reinforced concrete" or "concrete-steel" in this section shall be understood to mean an approved concrete mixture reinforced by steel of any shape so combined that the steel will take up the tensional stresses and assist in the resistance to shear.

Reinforced-concrete construction may be accepted for fireproof buildings if designed as hereinafter prescribed; provided that the aggregate for such concrete shall be hard-

burned broken bricks or terra-cotta, clean furnace clinkers entirely free of combustible matter, clean broken stone or furnace slag, or clean gravel, together with clean siliceous sand if sand is required to produce a close and dense mixture; and provided, further, that the minimum thickness of concrete surrounding and reinforcing members $\frac{1}{4}$ in. or less in diameter shall be 1in.; and for members heavier than $\frac{1}{4}$ in. the minimum thickness of protecting concrete shall be four diameters, taking that diameter, in the event of bars of other than circular cross-section, which lies in the direction in which the thickness of the concrete is measured; but no protecting concrete need be more than 4ins. thick for bars of any size; and provided, further, that all columns and girders of reinforced concrete shall have at least 1in. of material on all exposed surfaces over and above that required for structural purposes; and all beams and floor slabs shall have at least $\frac{3}{4}$ in. of such surplus material for fire-resisting purposes; but this shall not be construed as increasing the total thickness of protecting concrete as herein specified.

All the requirements herein specified for protection of steel and for fire-resisting purposes shall apply to reinforced concrete filling between rolled steel beams as well as to reinforced concrete beams and to entire structures in reinforced concrete. Any concrete structure or the floor filling in same reinforced or otherwise, which may be erected on a permanent centering of sheet-metal, of metal lathing and curved bars or a metal centering of any other form, must be strong enough to carry its loads without assistance from the centering, unless the concrete is so applied as to protect the centering as herein specified for metal reinforcement.

Exposed metal centering or exposed metal of any kind will not be considered a factor in the strength of any part of any concrete structure, and a plaster finish applied over the metal shall not be deemed sufficient protection.

Machine-mixing Necessary.

All concrete for reinforced concrete construction whenever used in such buildings must be mixed in a machine which mixes one complete batch at a time and entirely discharges it before another is introduced. At least 25 complete revolutions must be made at such a rate as to turn the concrete over at least once in each revolution for each batch.

Before permission to erect any concrete-steel structure is issued, complete drawings and specifications shall be filed with the Commissioner of Buildings showing all details of the construction, the size and position of all reinforcing rods, stirrups, &c., and giving the composition of the concrete.

The execution of work shall be performed by workmen under the direct supervision of a competent foreman or superintendent.

The concrete shall be mixed in the proportions of 1 of cement, 2 of sand and 4 of other aggregates as before provided; or the proportions may be such that the resistance of the concrete to crushing shall not be less than 2,000 lbs. per sq. in. after hardening for twenty-eight days, but for reinforced or plain concrete columns the mixture shall not be leaner than 1 part of cement, 2 of sand and 5 of the coarser aggregate in any case. The tests to determine this value must be made under the direction of the Commissioner of Buildings. The concrete used in concrete-steel construction must be what is usually known as a "wet" mixture.

Only high-grade Portland cements shall be permitted in reinforced concrete or concrete-steel constructed buildings. Such cements, when tested neat, shall, after one day in air, develop a tensile strength of at least 300 lbs. per sq. in.; and after one day in air and six days in water shall develop

a tensile strength of at least 500 lbs. per sq. in.; and after one day in air and twenty-seven days in water shall develop a tensile strength of at least 600 lbs. per sq. in. Other tests, as to fitness, constancy or volume, &c., made in accordance with the standard method prescribed by the American Society of Civil Engineers, may, from time to time, be prescribed by the Commissioners of Buildings.

The sand to be used must be clean, sharp grit sand, free from loam or dirt, and shall not be finer than the standard sample kept in the Department of Buildings.

The stone used in the concrete shall be a clean, broken stone, of a size that will pass through a $\frac{1}{2}$ in. ring, or good gravel may be used in the same proportion as broken stone, or broken hard bricks, or terra-cotta, or furnace slag, or hard clean clinkers may be used.

The steel shall meet the requirements of this code.

Concrete steel shall be designed in accordance with the following assumptions and requirements:—

(1) The adhesion between the concrete and the steel is sufficient to make the two materials act together; the unit value of the adhesion is at least equal to the unit shearing strength of concrete.

(2) The design shall be based on the assumption of a load four times as great as the total working load (ordinary dead load plus ordinary live loads) producing a stress in the steel equal to the elastic limit and a stress in the concrete equal to 2,000 lbs. per square inch.

(3) The modulus of elasticity of concrete at 2,000 lbs. per square inch is equal to one-eighteenth of the modulus of elasticity of steel.

(4) The steel takes all the tensile stress.

(5) The stress strain curve of concrete in compression, when the stress in the extreme fibre is 2,000 lbs. per square inch, may be assumed—

(a) As a straight line;

(b) As a parabola with its axis vertical and its vertex on the neutral axis of the beam, girder or slab; or

(c) As an empirical curve with an area one-quarter greater than if it were a straight line, and with its centre of gravity at the same height as that of the parabolic area assumed in (b).

(6) The assumption belonging to the common theory of flexure where not modified by any of the foregoing will apply.

Design of T-beams.

In the design of structures involving reinforced concrete girders and beams, as well as slabs, the girders and beams shall be treated as T-beams, with a portion of the slab acting as flange, in each case. The portion of the slab so acting shall be determined by assuming that in any horizontal plane section of the flange, the stresses are distributed as the ordinates of a parabola, with its vertex in the stress strain curve and with its axis in a longitudinal vertical plane through the centre of the rib of the T.

The shearing strength of concrete, corresponding to a compressive strength of 2,000 lbs. per square inch, shall be assumed at 200 lbs. per square inch.

All reinforced concrete T-beams must be reinforced against the shearing stress along the plane of junction of the rib and the flange. Where reinforced concrete girders carry reinforced concrete beams, the portion of the floor slab acting as flange to the girder must be reinforced with bars near the top, at right angles to the girder, to enable it to transmit local loads directly to the girder and not through the beams, thus avoiding an integration of compressive stresses due to simultaneous action as floor slab and girder flange.

Concrete in direct compression shall not be stressed, under the working load, more than 350 lbs. per square inch. Reinforced compression members shall be designed on the assumption that this stress in the concrete will be simultaneous with one of 6,000 lbs. per square inch in the steel. Should the use of hooped concrete be proposed, the working stresses will be a subject for special consideration by the Commissioner of Buildings.

In the execution of work in the field work must be so carried on that the ribs of all girders and beams shall be monolithic with the floor slab.

In all reinforced concrete structures special care must be taken with the design of joints to provide against local stresses and secondary stresses due to the continuity of the structure.

In the determination of the bending moments due to the external forces beams and girders shall be considered as simply supported at the ends, no allowance being made for continuous construction over supports. Floor-plates, when constructed continuous and when provided with reinforcement at top of plate over the supports, may be treated as continuous beams, the bending moment for uniformly distributed loads being taken at not less than $\frac{WL}{10}$; the

bending moment may be taken a $\frac{WL}{20}$ in the case of square floor plates which are reinforced in both directions and supported on all sides.

When the shearing stresses developed in any part of a reinforced concrete or concrete-steel constructed building exceed under the multiplied loads the shearing strength as fixed in this section, a sufficient amount of steel shall be introduced in such a position that the deficiency in the resistance to shear is overcome.

When the safe limit of adhesion between the concrete and steel is exceeded, provision must be made for transmitting the strength of the steel to the concrete.

Concrete-steel may be used for columns in which the ratio of length to least side of diameter does not exceed twelve. The reinforcing rods must be tied together at intervals of not more than the least side or diameter of the column.

The contractor must be prepared to make load tests on any portion of a reinforced concrete or concrete-steel constructed building within a reasonable time after erection as often as may be required by the Commissioner of Buildings. The test must show that the construction will sustain a load with a factor of safety for floors and structural members as required by this code.

Correspondence.

Flameproof Wood.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—As a practical worker in the art of flameproofing wood I have read with much interest your remarks on p. 25 of the Fire Supplement to your issue for April 11th on Professor Lewes's endorsement of the use of flameproof wood as being one of the best methods of fire-protection possible to employ. It is one of the most surprising facts in the whole range of building construction that architects do not make use of this wonderful means of protection against fire, the merits of which they seem to be so densely ignorant about.

Nothing is simpler, both in theory and practice, than making wood so resistant to fire that it is practically impossible with any of the ordinary means which produce conflagration to set it alight, and the cost of doing so, owing to improvements in the last few years, is now quite reasonable.

Every engineer knows the old-established

process of impregnating wood with creosote for the purpose of preserving it. Now, flameproofing wood is simply impregnating it, not with creosote, which is a highly inflammable product, but with an anti-pyrene or flameproof chemical, many of which are known to all scientific men. The degree of fire-resistance obtained from wood impregnated with suitable anti-pyrene chemicals is simply enormous. For instance, a shovelful of live coals may be thrown upon naked floor boards which have been impregnated without setting the wood alight; a powerful Bunsen burner may be left blazing for hours in contact with a door made of impregnated wood with perfect safety. A short-circuit may occur in casings made of treated wood. Only local charring results in any of these cases. The treatment is permanent, wood which has been treated remaining flameproof for all time.

How then can it be explained, if these great advantages exist, that architects when they are instructed to design a fireproof building ignore this wonderful means of protection? I have followed the art of flameproofing wood from its inception in this country some eight years ago down to the present day, and I can conscientiously say that I have never heard a single objection to the use of flameproof wood that was worthy of the name. By this I do not mean to say that wood impregnated with any antipyrine chemical is necessarily satisfactory. Far from it. Many cheap antipyrines, such as sulphate of alumina, sulphate of soda, chloride of ammonia, tungstate of soda, &c., when impregnated into wood will afford some protection against fire, but such protection is entirely negated by the attendant disadvantages which they possess of absorbing moisture from the atmosphere, corroding metal fastenings, and causing the paint to peel off. I can assert, with absolute positiveness from years of experience, that if wood is impregnated with an aqueous solution of phosphate of ammonia and boracic acid to the extent of 4 lbs. per cub. ft. of the solids being dispersed throughout the wood, that such wood will be free from all such disadvantages and will be rendered flameproof for all time. Such wood cannot be distinguished from ordinary wood either in working or painting, or in any other respect except in the one feature that it will not spread flame.

The reason why properly treated wood does not spread flame is as simple as that of the making of it flameproof. It is not due, as some people suppose, to incombustible gas being generated under heat, for no gas is generated. On the contrary, the protection is due to the crystals of the antipyrine chemicals forming under fire a coating around the fibres of the wood, which coating protects the fibres from the oxygen of the air having access to the same, and as everyone knows, oxygen is necessary to produce flame from heated wood.

If any of your readers desire to prove for themselves the fact that the protection is due to such coating, let them drop a pinch of phosphate of ammonia on a red hot shovel and they will see a glassy coating instantly forming on the shovel, through which air will not penetrate.

Now the above facts are known to such men as Professor Lewes and every other advanced scientist, hence they strongly advocate its use, but their advocacy does not avail until the working architect gets the fact through his head, and until then there is no hope for the public. Their client's property must go on burning in the usual way, simply because the architect is either too indolent to find out for himself that the above are truths or too indifferent to apply the same and protect the clients buildings against danger from fire.—Yours faithfully,

LONDON. A. W. BAXTER, A.M.I.N.A.

FIRE TESTS.

A Concrete Floor with Expanded Metal Lathing.

IN continuation of a series of reports by the British Fire Prevention Committee on reinforced concrete floors, Report No. 109 describes a fire test where the concrete is reinforced by expanded metal lathing. Here we have a floor across a testing chamber measuring 10ft. by 22ft., supported by ordinary joists. One of the joists (joist B) was encased with expanded metal lathing and about 2ins. of concrete, there being an air-space between the flange of the girder and the casing whilst the other joist (joist A) was solidly encased without an air-space.

The nett result of this test was eminently satisfactory, as will be seen from the official summary given below, classification as "fully protective" (class B.) on a four hours test, followed by five minutes of water, having been obtained, the temperatures exceeding 1,800 degs. Fahr.—in fact, touching 2,200 degs. Fahr.—the load being the usual $2\frac{1}{2}$ cwt. per ft. super.

We present a photograph of the floor under test, and besides reproducing the summary we give the note by Mr. Max Clarke, drawing attention to the fact that the hard and dense materials which are best adapted to give

strength to the concrete are probably the worst in the event of a fire, but also draws attention to the necessity of making all allowances for faulty and careless construction. The concrete aggregate used in this test was a broken-brick concrete aggregate in the proportions of 1 of cement to 4 of aggregate, there being broken brick 2'66, sand 1'33, to "Ferrocrete" Portland cement 1.

Summary of Effect.

On the gas being lighted the setting coat of plaster fell off in large quantities.

In 20 mins. portions of the concrete were exposed, the coats of plaster having fallen.

In 50 mins. more than half the concrete of each bay was bare, the plaster having fallen.

In about 60 mins. a portion of the concrete casing fell from joist A, no metal visible.

In 65 mins. a good deal of the two outer coats of plaster fell from joist B, which had a plaster casing, not solid.

In $2\frac{1}{4}$ hours there were cracks in the upper surface of the floor.

At the conclusion of the test joist A had deflected $\frac{1}{4}$ in. and joist B $1\frac{1}{4}$ in.; the fire did not pass through the floor.

On examination after the test it was found there were some cracks across the top of the bays of concrete near the beams and a few other small ones, but the cracks were not wide, none exceeding $\frac{1}{32}$ in.

On the underside there was one crack in the centre of the S bay, composed of fire-brick, about $\frac{1}{4}$ in. wide, and two very slight cracks in the N bay composed of stock brick.

No damage was done to the underside of the concrete of either the centre or N bays by fire or water.

Classification was obtained.

Note by Mr. Max Clarke.

"I suppose this might be called a test of 'reinforced concrete,' and as such the point which strikes me most as worthy of attention is the extreme difficulty in placing the reinforcing material in exactly the place in which it will prove most effective.

"This form of construction is engaging the attention of scientific men in many parts of the world, and it appears to me that large allowances will have to be made for faulty or careless construction in addition to the usual margin of safety.

"Another matter which will require investigation is that hard and dense materials which are best adapted for giving strength to concrete construction are probably the worst which could be used in the event of fire.

"Only the practical results given by time and accident will answer these questions fully, but they should not be overlooked by those who advocate a new departure in this direction."

FLOOR SLABS OF BROKEN-BRICK CONCRETE REINFORCED WITH EXPANDED METAL, AFTER THE FOUR HOURS' FIRE TEST.

SPECIAL SUPPLEMENT.	
Reconstruction of a Factory Building at Kilbowie, near Glasgow. With twelve photographic views showing the work in progress - - -	- I-8

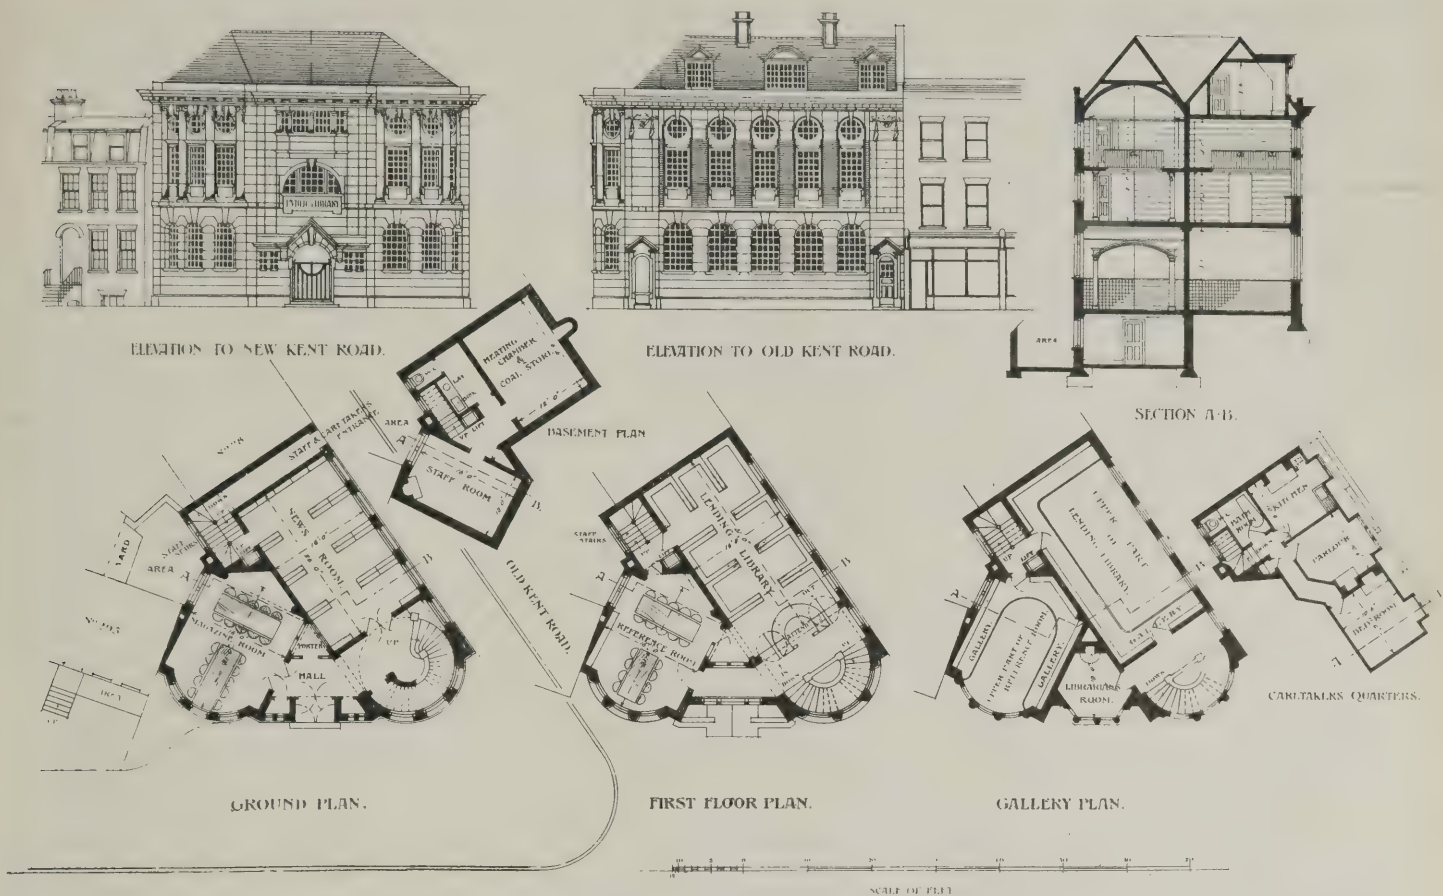

A City in the Making. THE Press had an opportunity last Saturday of seeing what progress had been made in the construction of the first garden city—Letchworth. This experiment is indeed of considerable importance; it holds out bright prospects for the future; and we are now glad to be able to state that the scheme promises to be a great success. After about two years' work, a wonderful change has come over the scene, although the end is by no means in sight. Water and gas works and factories have been erected and are in full swing, and a number of picturesque cottages have been built. The object of the promoters is to create a town of about 30,000 inhabitants on an area of 3,818 acres, of which the company possesses the freehold. About 1,300 acres will be used for the erection of the town, and the remaining 2,500 acres retained for agricultural purposes. The company will let the land on lease at a ground rent. Dividends to shareholders will be limited to a cumulative dividend of 5 per cent. per annum, the remaining profit being used for the benefit of the town. The control from the commencement obviously offers an unparalleled opportunity for providing wide and ample thoroughfares, sites for public buildings, open spaces and allotments, land being cheap. The following

is a summary of the development:—Over $4\frac{1}{2}$ miles of new roads have been made; $14\frac{1}{2}$ miles of water mains, 8 miles of gas mains, and 8 miles of sewers have been laid. Waterworks and gasworks have been constructed. Extensive railway sidings have been made. Sites for the erection of 520 houses, 25 shops, seven factories, a church, a chapel, a public hall, schools, &c., &c., have been let or selected. The rates on the estate are from 2s. 8d. to 3s. 2d. in the £. In September, 1903, the population was about 400; the population is now over 1,600, including 400 artisans and labourers. There are also 600 men working on the estate who do not live upon it, and of these about 300 desire houses at Letchworth. The First Garden City, Ltd., has a capital of £300,000, and about £134,000 of this has been allotted, and the balance is about to be offered for public subscription. The extra capital will be devoted, among other things, to the building of houses. Up to the present the provision of housing accommodation has been left to the private speculator, but it is realized that the inadequacy of the supply may inconvenience manufacturers. It is obvious that when firms decide upon building factories they will lose no time in their construction. The result will be that there will be a great demand for labour which will need housing accommodation, and unless the company take the matter in hand there is little doubt that there will be shortage in this direction. A large number of the cottages erected up to the present have been built by the Garden City Tenants, Ltd., a society which has for its object the co-operative ownership of the houses of its members. This company has erected or is erecting about 100 houses. It is not the promoters' idea to build a model city, which might easily be done by philanthropy, but to show how a city may be built on normal lines. Dependence is placed, therefore, upon private speculators. The company merely provide the opportunity for others to use their capital in the promotion of a town on better lines than existing towns have grown. Up to the present the company have been developing what might be called the outskirts of the town rather than the centre, the idea being that when the estate has partially developed the central sites will become of greater value. The natural growth of towns has always been from the centre outwards, and at the present moment there is no main street to give a nucleus to the town, and the houses seem somewhat dotted about in the wilderness, and if the company propose to encourage speculators to aid in the rapid development of their estate they should hold out special inducements and give some chance for the speculators to reap a portion of the reward. The character of the buildings being put up is good, and it seems probable that the Garden City, if not ideal, will be a considerable advance on any other existing provincial town of similar size.

Mr. Shaw and Regent Street. MR. NORMAN SHAW's fine scheme for the rebuilding of Regent Street Quadrant, exhibited at this year's Royal Academy exhibition, has met with opposition from the lessees and occupiers of the premises to which it is proposed to add a new façade. They are petitioning the Commissioners of Woods and Forests about the matter. They find no fault with Mr. Shaw's architecture. Their complaint is that the proposed new frontages would be quite unsuitable from a trading point of view, or to put it in their own words, "much too elaborate, and such as to be financially beyond the reach of the ordinary lessee, who has to consider the letting value of them when erected." Their objection is that the heavy columns proposed for the ground floor would not only take up a great portion of the shop-window space, but would entirely break the continuity of the window line, rendering it almost impossible for any one occupier to have a succession of shops. The windows would be set back so as to be hidden from the view of persons walking up and down the street, except the actual window they happened to be opposite. All the advantages which they now enjoy in the display of their goods would, it is contended, disappear, and Regent Street would be entirely ruined as a shopping centre. Regent Street is owned by the Crown, who will not rebuild the premises when the leases of the shops expire in the course of the next twelve years; so that the obligation to build in accordance with Mr. Shaw's design will rest apparently on the present traders, who have the ground on building lease. We cannot, however, admit the contention of the shopkeepers. Their arguments are the old ones, arguments which have made impossible all architectural feeling, by reason of the insistence that there shall be a base of plate glass to the building. Yet it is obviously impossible for a shopkeeper to show the whole of his wares in the window, which becomes therefore his means of exhibiting such goods as will attract customers inside the shop, where there is space for the adequate display of all the goods for sale. As a contrast to these ideas of the English shopkeeper we have only to turn to the shops of Paris. These consist of large "magasins," where the goods are arranged artistically inside the shop and with plenty of circulating space, so that possible customers are attracted into the shop and can walk round and view goods without feeling that they will be pestered to make purchases. The same system is followed in towns abroad and in America. Blocks of shops under one proprietorship with as heavy supports as proposed are to be found as financially successful as any in Regent Street, and there seems no reason why the same treatment should not apply there. We hope the Commissioners will not be frightened by the assumption of the shopkeepers of a vested interest to which they have no right.

Basement Plan:
SOUTHWARK PUBLIC LIBRARY: FIRST-PREMIATED DESIGN. W. CLAUDE BATLEY, A.R.I.B.A., ARCHITECT.
(On the "open access" system.)

SOUTHWARK PUBLIC LIBRARY: SECOND-PREMIATED DESIGN. SPENCER W. GRANT, A.R.I.B.A. AND JAMES A. BOWDEN, ARCHITECTS.

SOUTHWARK LIBRARY COMPETITION.

AS announced in our last issue, the competition for the proposed public library to be built at the corner of the Old and New Kent Roads, London, S.E., has been decided in favour of Mr. W. Claude Batley, A.R.I.B.A., of Kettering, and 115, Gower Street, W.C., his design (No. 46) having been placed first by the assessor, Mr. A. W. S. Cross, F.R.I.B.A.

We reproduce herewith Mr. Batley's design, together with the second-premiated design (No. 60), by Mr. Spencer W. Grant, A.R.I.B.A., and Mr. James A. Bowden, of Moorgate Station Buildings, Finsbury Pavement, E.C. The third-premiated design (No. 8) is by Messrs. W. T. Springall & Simpson Taylor, of 86, Rosemeath Road, Urmston, Manchester.

Ninety-nine designs were submitted in this competition, but eight were disqualified by reason of their non-compliance with one of the conditions as set forth in the committee's reply to question 22, a copy of which was sent to each competitor.

Mr. Cross in making his award has followed the admirable practice of giving a short critical note on every design submitted. It is pointed out that owing to the restricted nature of the site an ideally perfect grouping of the departments is impossible, because any combination of public rooms arranged, as required, on the ground and first floors only is open to one or another reasonable objection. This being the case, the assessor endeavoured to show no undue preference to any particular system of grouping, but regarded the provision of spacious, well-lighted and well-shaped rooms as being of primary importance.

Mr. Cross makes the following notes on the three premiated designs:—

No. 46.—The plan is exceedingly well arranged and compact, and the design is illustrated by good drawings.

No. 60.—This is a cleverly arranged and well-balanced plan, marred however by the position assigned to the librarian's office, which is also too small for the purposes of a committee-room. The lending library is on the first floor, but it is an exceedingly well-lighted room, and the departmental arrangement chosen has the advantage of bringing the reference library in close connection with the lending library, which is advantageous to the economical administration of a small library establishment. If the pedimental hood of the principal entrance were redesigned, and the orders of the wing projections continued to form an open loggia over the doorway, the design would be much improved.

No. 8.—A carefully thought-out plan with a good reference library. There is a loss of space in the entrance hall. Unfortunately the design is not accompanied by a good elevation.

First-premiated Design.

The author of the first-premiated design, in the notes accompanying his drawings, observes that every room is symmetrical, while full advantage has been taken of the quiet character of the New Kent Road frontage. The keynote is the ease of superintending all departments with a small staff: two persons, in fact, could well control the whole library—one at the desk in the lending library, from which the whole of the newsroom can be seen, and the other in the librarian's room, with the reference, magazine and ladies' rooms under his supervision. The difference in level between the newsroom and lending library facilitates this supervision, at the same time giving an opportunity to more effectually light the basement rooms. The lending library is on the open-access system, as desired, and the bookcases are so placed that the borrowers are all within view of the librarian's table. The book accommodation is supplemented

by the book-store in the basement. Rooms for the caretaker are provided on the second floor, and the flat over the reference library and librarian's room would form a roof garden, for which purpose the parapet-wall towards the New Kent Road has been kept high. The building is proposed to be built of Portland stone; heating by low-pressure hot water, and ventilation by a mechanically-aided "natural" system.

The bookcase accommodation has been calculated at ten volumes per foot run, with cases eight tiers high, except in the reference library, where it has been taken at nine volumes per foot run with cases seven tiers high.

The accommodation is as follows:—

Basement:

Filing room, 1,350 volumes.

Book store, 9,360 volumes.

Ground Floor:

Lending library, 10,640 volumes.

Newsroom, 30 readers—10 at slopes, 18 at tables, and 2 at directory and time-table stand.

First Floor:

Reference library, 4,491 volumes (12 readers).

Magazine room, 378 volumes (35 readers).

The total cost of the building is put at £5,900, this being made up as follows:—

70,500 cub. ft. at 1s.	£3,525
Parapet wall and chimneys not included in cubing	100
Heating and ventilating	300
Electric lighting and gas	300
Furniture and fixtures	1,500
Carving	175
	£5,900

A Sanatoria for Workers suffering from Consumption is to be built at Benenden, in Kent. The foundation stone will be laid next month. Provision for thirty beds will be made as a start, additional beds to be provided as further funds are received. The National Committee entrusted with the scheme, with Princess Christian as their head, earnestly appeal for donations, which should be sent to Mr. E. Douglas White, 19, South Molton Street, Bond Street, London W.

NOTES ON COMPETITIONS.

Coopers' Company's School, Bow.

In the announcement of the award in this competition published on p. 300 of our issue for last week the name of Mr. Alan E. Munby was incorrectly given "C. G. Mumby," as joint architect with Mr. T. Phillips Figgis of the first-premiated design. We regret the error.

Standard Colour Card Competition.

A notice of this competition has already appeared in these columns, but we are glad to hear from the promoters, Messrs. Pinchin, Johnson & Co., Ltd., varnish, colour and paint manufacturers, of 23-25, Billiter Street, E.C., that applications for the sample colour slips are coming in from all quarters. Those who have not already applied should do so, as the competition will close towards the end of next month. Messrs. Pinchin, Johnson send us a set of the colour slips complete. The object of the competition is to establish a standard card of sixty different colours. The colour slips are sent out in numbered envelopes, each containing four slips giving four different shades of every colour. From each of these four shades competitors have to select the one which corresponds most nearly to their idea of what the colour should be: thus, there are four different shades of lemon chrome, envelope No. 10, marked a, b, c and d respectively. The selection has to be made for the whole sixty colours and the slips stuck down on the card. The promoters will build up their standard card in accordance with the selections made, and the competitor whose card is nearest the "standard" will be awarded the first prize of £50; the second £20, the third £10, and the next twenty £1 each. After the competition is over, and the awards have been made, Messrs. Pinchin, Johnson will make available this set of colours, agreed to by general consensus of opinion as being of the particular shades named: and such a card should be of very great service to painters, decorators and architects.

Hospital at Leuchars, Edinburgh.

Twenty-five designs were submitted to Mr. Morham, the city architect of Edinburgh, for the infectious diseases hospital to be erected at Leuchars, and the first premium has been won by Mr. W. Carruthers Laidlow, of 4, York Buildings, Edinburgh.

Competitions Open.

The following is a list of competitions open:—

DATE OF DELIVERY.	COMPETITION.
June 26	NURSING AND CONVALESCENT HOME AT GLOSSOP, to cost £6,000. Premiums of £20 and £10. Particulars from Mr. T. W. Ellison, town clerk, Norfolk Chambers, Glossop.
" 30	ELEMENTARY SCHOOL AT EAST WEMYSS. Particulars from Mr. A. Watson Taylor, clerk to the School Board, East Wemyss, R.S.O., Fifeshire.
July 2	SECONDARY SCHOOL FOR GIRLS AT AIGBURTH VALE, for the City of Liverpool Education Committee. Limited to architects in Lancashire and Cheshire. Particulars from the Town Clerk, Municipal Offices, Liverpool.
" 4	SCHEME OF SEWERAGE AND SEWAGE-DISPOSAL WORKS AT WARBLINGTON. Premiums of £100 and £50. Particulars from Mr. J. W. Loader Cooper, clerk to the U.D.C., Queen Street, Emsworth.
Oct. 1	ALPHABET COMPETITION. Prizes of £20, £10 and £5. For particulars see "Architectural Review."
" 31	BOURSE AT CAIRO.—Premiums of £250 and £100. International competition. Designs to be submitted to the "Corporation des Agents de Change," Cairo, Egypt.
—	NEW MUNICIPAL BUILDINGS AT STIRLING (to cost £12,000). Premiums of £100. Particulars from Town Clerk, Borough Buildings, King Street, Stirling.

THE NEW WARING BUILDING.

THE splendid building which Messrs. Waring & Gillow have erected in Oxford Street is now open to the public, and should be visited by every architect who is interested in modern design and decoration, quite apart from the display of old and new furniture to be seen there. Of the façade of the building we need not now speak, as a critical note on the design appeared in our columns two weeks ago. It is certainly a tribute to the ability of the architect, Mr. R. Frank Atkinson, F.R.I.B.A. The interior of the building, however, is the great sight. From an architectural point of view there is first the rotunda, into which the spacious entrance-hall leads. This rotunda is the focus of the interior. Its diameter is 54ft. and its height about 85ft. For the bottom 17ft. the walls are lined with a dull-polished stone, and then comes the first-floor balcony, supported on bronze brackets, the walls above being carried out in a light yellow stone; the whole constituting a very fine feature. Another notable place is the linen department, the design of which is based on what is called the "Colonial Adams" style. This is quite a unique shop, the woodwork, including elegant pilasters, being of waxed mahogany throughout, forming a most delicate colour scheme in conjunction with the soft green carpet and the silver-grey of the walls above the arches. Another fine room is the antique salon on the first floor, decorated in Georgian style and embellished with a richly-modelled plaster ceiling. The restaurant on the third floor is still another most delightful room—it is essentially modern in colour and design, with a mantelpiece in oak and tile work; and the ladies' room adjoining is also a most attractive apartment. These strike us as being perhaps the most notable rooms of the interior, but there are scores of others which charm the eye. From the standpoint of furniture and furnishing, of course, the ruling feature is the arrangement of innumerable rooms shown complete in every detail. It need hardly be pointed out what an excellent way of exhibiting furniture this is, and how much better the effect of any particular article can be judged than when seen jumbled up in the ordinary show-room. The schemes are ranged from the lowest to the highest prices. There are complete houses shown, from kitchen to

attic, and in every case the most consummate taste is apparent. The rooms are far too numerous for us to attempt any particularization of them. We can only say how impressed we were with the excellence of their arrangement, the variety of their colour schemes, and, with all, the admirable sense of cosiness. The rooms are furnished to live in as well as to look at, and on that account we are sure they will be appreciated by every visitor to this most remarkable building.

[When using the illustration of the front of the building in our issue for May 30th we omitted to state that we were indebted to the Columbian Fireproofing Co., Ltd., for the block. We now make that acknowledgment.]

A PRICE LIST FOR ESTIMATING.

WITH our monthly "Contractors' Supplement"—the next of which will appear in our issue for June 27th—readers will remember we have included a list of fittings and specialities used in buildings, each item being priced, and particulars given of its size, weight, &c. This list is a most useful one, as it affords in a compact form a record of new specialities put on the market, as well as of the fluctuations in the prices of old-established goods. The ordinary price-books, by reason of their being published at yearly intervals, must necessarily get out of date, and it is on that account our list is particularly serviceable. Moreover, to architects writing specifications and builders preparing estimates it is of special use, as it affords prices and particulars which cannot be found elsewhere.

Mr. T. Parsons, retired builder, of Truro, died recently.

Mr. Allen Levey, builder, of Bishop Stortford, died recently in his seventieth year.

Stone Preservation.—Satisfaction is expressed by Mr. Alexander Muir with the result of coating the masonry of the large pile of municipal buildings at Glasgow with Szerelmey stone preservative liquid. Although some stones are showing decay since they were treated, yet Mr. Muir considers that they should have been cut out and replaced by new masonry.

This house is proposed to be built on an exposed site in Perthshire, with a south aspect. The walls will be of local stone and the roofs covered with red tiles. The half-timber and external doors will be treated with Carbolignum. The accommodation provides three sitting-rooms and offices on the ground floor, and five bedrooms, with billiard-room in the roof. The architect is Mr. Ernest G. Theakston, of 4, Hildrop Road, London, N.

R.I.B.A.

A BUSINESS meeting of the Royal Institute of British Architects was held on Monday evening at 9, Conduit Street, W., the chair being occupied by Sir John Taylor, K.C.B., vice-president.

The following elections took place:—

As Fellows.

(Of London where not otherwise stated.)

C. H. Ashworth (Dublin)	A. B. Jackson
T. Baird, junr. (Glasgow)	R. C. James (Bristol)
Andrew Balfour (Glasgow)	W. T. Jones (Durham)
R. S. Balfour	H. V. Lanchester
Andrew Black (Glasgow)	C. H. Lohr
G. Bland (Harrogate)	R. S. Lorimer (Edinburgh)
P. Bown (Harrogate)	R. J. Macbeth (Inverness)
Walter H. Brierley (York)	W. F. McGibbon (Glasgow)
J. Dixon Butler	H. P. G. Maule
J. A. Campbell (Glasgow)	R. Miller (Glasgow)
H. E. Clifford (Glasgow)	E. A. Rickards
J. McLean Crawford (Glasgow)	F. W. Roberts (Taunton)
N. C. Duff (Glasgow)	G. H. Sale (Derby)
W. N. Dunn	R. D. Sandilands (Glasgow)
W. A. Forsyth	A. Skirving (Glasgow)
W. V. Gough (Bristol)	J. Thomson (Glasgow)
John Hamilton (Glasgow)	W. S. Wilson (Durban)
W. Cecil Hardisty (Manchester)	W. H. Wood (Newcastle-on-Tyne)
F. G. Hicks (Dublin)	H. T. Wright (Newcastle-on-Tyne)
J. K. Hunter (Ayr)	

As Associates.

E. A. Agutter (Pietmaritzburg)
John Barr (Lindfield, N.S.W.)
A. F. Benjamin
J. T. W. Brooke (Manchester)

As Hon. Associate.

Dr. C. H. Smith, Keeper of Greek and Roman Antiquities at the British Museum.

As Hon. Corresponding Members.

J. T. J. Cuypers, C.E., Amsterdam.
H. Muthesius, Berlin.

Following the business meeting a general meeting was held, when an adjourned debate took place on Mr. Paul Waterhouse's paper on the London Traffic Commission report. A resolution proposed by Mr. H. D. Searles-Wood and seconded by Mr. John Slater was adopted suggesting that architects should be represented on the Traffic Board proposed by the Royal Commission, or competent professional assistance employed by the board. Professor Beresford Pite, Sir Aston Webb, and Messrs. E. W. Hudson, W. Woodward and the chairman took part in the discussion.

STANDARD TEMPLATES FOR PIPE FLANGES.

IT has been considered by the Engineering Standards Committee that templates for pipe flanges could be manufactured more cheaply and accurately in quantities by proper machinery than by the old-fashioned way of making a single template at a time. They entered therefore into an arrangement with Messrs. Joseph Sankey & Sons, Ltd., of Bilston, who have long been known in the electrical world for their accurate stamping of core discs for dynamos and motors, to manufacture commercial sets of standard pipe flange templates in large quantities. In order to ensure a high degree of accuracy the Committee first arranged for the manufacture of a set of male templates for all the sizes and drillings recommended by them in their standard tables for pipe flanges (Report No. 10). These male templates were forwarded to the National Physical Laboratory, where they were carefully measured up and a certificate of their accuracy obtained. All the commercial sets are carefully checked against the verified standard set before being issued. Accuracy of drilling is thus ensured, and it is hoped that the difficulty of flanges made by one maker refusing to fit the flanges of another, though they both may purport to be drilled in accordance with the Committee's recommendations, will be overcome. All engineers at one time or another have experienced the difficulty and annoyance of finding that flanges which have been nominally drilled to the same dimensions refuse to go together because either the bolt circles are slightly different or the spacing of the holes is not

quite uniform. The fact that all commercial templates will fit in any position the corresponding certified male templates effectually does away with these difficulties, and the templates being made in large numbers Messrs. Sankey are enabled to offer them at a price below that at which an engineer could make them for himself. The templates are made of thin steel plate painted over with aluminium paint, a small piece being cut out at the extremity of each centre line so as to enable the fitter to see that the centre line of the template coincides with the centre line of his flange. In the interest of the engineering industry it is desirable that the existence of these templates should be as widely known as possible in order that full advantage may be taken of the standardization which the Committee has sought to effect.

Notes and News.

The A.A. Third Summer Visit will take place next Saturday, to Ightham Mote, near Sevenoaks, and Fairlawn, Tonbridge.

The Exhibition of Model Cottages at Cleveleys, near Blackpool, is to be opened next month. About a dozen cottages are in course of erection.

Quantity Surveyors' Association.—Mr. A. J. Gate, F.S.I., of London, is the new president of this Association, and Messrs. H. Curtis-Card, F.S.I., and W. R. Hood, F.S.I., are the new vice-presidents.

Workmen's Compensation.—At the Wigan County Court recently a joiner's apprentice named Bell obtained £50 18s. and costs from a builder named Ablett as compensation for the loss of two fingers cut off by a planing machine.

Messrs. Mellowes & Co., Ltd., of Corporation Street, Sheffield, have secured the orders for glazing, on their "Eclipse" patent imperishable system, the roofs of extensions to works of Messrs. Cammell, Laird & Co., Ltd., at Sheffield; Hadfield's Steel Foundry Co., Ltd., Sheffield; Marshall, Sons & Co.'s works at Gainsborough; Denaby & Cadeby Main Collieries, Ltd., Conisbro'; Platt Brothers & Co., Ltd., Oldham; and Samuel Fox & Co., Ltd., Stocksbridge. Also the Grangemouth Dock Extension, Caledonian Railway; the Vegetable Market Extension, Bradford; and the Torquay Car Sheds Extension.

The Condition of Earlswood Asylum.—The Asylum for Idiots at Earlswood, Redhill, has for the past three years been in a critical condition by reason of its faulty foundations. Extensive works of a temporary as well as permanent character have been carried out at heavy expense, involving filling in solid foundations, pulling down and rebuilding dangerous portions of the structure, as well as shoring up and holding together the sections of the building under treatment. Two-thirds of the work have been completed, but more has been found necessary than was at first anticipated. Not only have the walls had to be underpinned to a depth of 5ft., but they have also had to be re-faced with brick, owing to the outer facing of stone having separated from the inner wall.

Alleged Illegal Position of Sub-Contractor.—At last week's meeting of the Blackpool Town Council, Councillor Ellis asked if it was correct that the sub-contractor for the proposed new Council school in Waterloo Road was an alderman of the Council and a justice of the peace. A councillor stated that this was the case. The town clerk, in reply to Councillor Ellis, said he did not think the position was illegal. Councillor Ellis said the Act distinctly stated that such a position could not be held, and he should communicate with the Local Government Board in regard to the matter.

Mr. George Langridge is the new president of the Surveyors' Institution.

A General Lock-out in the Building Trade at Vienna has been declared, affecting 150,000 men.

Change of Address.—Messrs. Hubbard & Moore, architects and surveyors, have removed from 85, Gresham Street to 112, Fenchurch Street, E.C.

Cottage Baths.—The Birmingham Corporation propose to erect cottage baths on a site in Bordesley Street at a cost of about £2,000: this as an experiment.

The Amsterdam Exchange, completed only a few years ago at a cost of £850,000, has been condemned by an expert commission. The foundations have given way, and cracks have appeared in the building.

A German Visit.—A party of German architects and students from the Royal Technical School, Hanover, left England on May 29th, after a stay of about a fortnight. They had been visiting the principal cities and towns, studying the architecture of cathedrals, municipal buildings and other institutions. More especially they paid attention to Gothic and Early English architecture. Herr W. V. Roeder, an accomplished linguist and an old Edinburgh student, was in charge of the party, which included Professor Mohrmann, one of the first Gothic authorities in Germany, and Professor Jordan, an eminent painter.

A revised and enlarged catalogue of warming and ventilating appliances has just been published by Messrs. John Gibbs & Son, of 72-76, Duke Street, Liverpool. The greater part of the book is devoted to ventilation, in connection with which this firm have a deservedly high reputation, their appliances being extensively used by the Admiralty, H.M. Office of Works, and leading railway companies, corporations and architects. Many of the designs for extractors, apart from the effectiveness of their construction, have architectural merit and are by no means disfiguring to any building upon which they may be placed, as is too often the case with ventilating flèches.

Plymouth Asylum Extension.—The extension to the Plymouth Borough Asylum, at Wrangaton, was opened by the mayor on Wednesday last. It provides additional accommodation for 200 patients, in two wards; thus bringing the total accommodation up to 400. Messrs. Hine & Odgers, of Plymouth, were the architects, and Messrs. Dart & Pollard, of Paignton, the builders, whose contract was for £32,126 (this firm however failed, and the work was completed by the trustee of the estate, through Mr. W. H. Lethbridge, of Paignton). The sanitary work was carried out by Messrs. Doulton & Co., of Lambeth, and the hot-water supply and general engineering by Messrs. J. Weeks & Co., of Chelsea.

Tension in the Bradford Building Trade.—A somewhat piquant situation has developed in the Bradford building trade as the outcome of allegations made by the Trades and Labour Council that operatives have been "victimised" in consequence of the action of trades unionists in building trade disputes. So much publicity had been given to these charges that the Bradford and District Building Trades Federation felt bound to take notice of them. A letter was therefore written by the secretary of the Central Board to the secretary of the Trades Council inviting that body to substantiate the charges before a special meeting of the Board, which he offered to convene for the purpose. The secretary of the Trades Council has replied stating that though his council are convinced that the charges are well founded, and that no further proof is needed, they "do not propose to subject any workman to further risk by offering evidence."

THE TIMBER TRADE.

London Market in May.

DURING the past month the London timber market has undergone little change beyond some appreciation in the prices of floorings, battens and scantlings, which is satisfactory so far as it goes but is evidence rather of a scarcity of stock than of an increased demand for it. There is a further reduction in the deliveries of 1,700 standards from the docks, and nearly 600 standards overside, and this continued decline in the volume of the business on the Thames has made London buyers callous of the strong position of the markets in practically all wood-exporting countries. The free on board market for all sizes except deals continues strong, and a fair business has been possible during the month. Messrs. Churchill & Sim report that a few cargoes of deals were sold for shipment outside Europe at quite satisfactory prices, but the demand from the Cape is lifeless, and is likely to continue so until enterprise is stimulated by a final settlement of the labour problem. Very little progress was possible on the Russian side during the month, buyers' and sellers' ideas of prices being out of harmony for the moment. There is no difficulty in securing plentiful tonnage at cheap rates, and, if anything, freights are rather easier.

Messrs. Denny, Mott & Dickson, Ltd., report on Baltic and White Sea goods as follows: "The volume of trade during May has improved, and this, in face of the continued upward trend of prices, shows a more satisfactory position. The caution which has hitherto been a marked feature of this year's business is still in evidence; and the bulk of present transactions go to fill temporary requirements only. Very little forward buying is being done. The recent prices ruling in the auctions show a continued demand for spot good, and two or three shippers have been tempted to venture consignments, which, however, have given very indifferent results to them. Floorings and all sizes of battens and scantlings are a firm market; but deals, especially in the lower qualities, are decidedly weak. Whether prices will be sustained at the present level depends on imports being on a moderate scale; but granting this, the outlook for the autumn trade should not be unsatisfactory."

The abstract of dock stock, consumption, &c., for May, published by Messrs. Foy, Morgan & Co., is given in the table at the foot of this page.

Dock Stock.

The stock of wood in the public docks on May 31st was:—

	Pieces.
Foreign deals and ends - - -	642,000
Do. battens - - -	1,057,000
Pine deals and battens - - -	551,000
Spruce do. do. - - -	443,000
Boards, rough - - -	2,361,000
Do. prepared - - -	4,985,000

totalling 10,039,000 pieces, as against 12,412,000 in 1905, 14,333,000 in 1904, and 14,254,000 in 1903.

In other kinds the stock was as follows:—

Foreign wainscot logs - - -	356 pieces.
Do. oak timber - - -	501 loads.
Do. fir timber - - -	1,698 do.

Foreign Oregon pine, &c., spars and masts - - -	4,722 loads.
Colonial oak timber - - -	981 do.
Do. birch timber and planks - - -	3,197 do.
Do. elm and ash timber - - -	581 do.
Do. yellow pine - - -	220 do.
Do. red pine - - -	64 do.
United States pitch-pine timber - - -	12,174 do.
Do. do. deals - - -	12,000 pieces.
East India teak - - -	7,993 loads.

Deliveries.

The deliveries have been—

	First five months. Pieces.	May. Pieces.
Foreign deals and ends - - -	1,377,000	278,000
Do. battens - - -	2,296,000	481,000
Pine deals and battens - - -	444,000	98,000
Spruce do. do. - - -	504,000	109,000
Boards, rough - - -	2,263,000	439,000
Do. prepared - - -	5,795,000	1,278,000
Total - - -	12,679,000	2,683,000

The deliveries from ship to craft have been—

	First five months. P.s.h.	May. P.s.h.
Deals and battens - - -	17,625	7,607
Boards - - -	5,508	1,964
Total - - -	23,133	9,571

Soft Woods.

Swedish Deals and Battens.—The importation has been on about the same scale as last year, but the demand has shown no elasticity. Prices for floorings and for all sizes of battens and scantlings remain firm, but deals continue to be neglected, and the stock of all descriptions is the smallest in the recent history of the trade.

Norwegian Boards.—Prices for floorings improved during the month in sympathy with smaller shipments from the other side, and owing to the higher cost of new supplies in the immediate future.

Russian Deals.—There is no change to record in prices of White Sea deals either here or for shipment. Shippers are quite content to wait until buyers are in the market again, which they are not at present except at some concessions in prices, and these are not forthcoming.

Finnish Battens and Boards.—So far the importation has been limited to one full cargo. Prices have slightly improved for scantlings and battens.

Prussian Timber.—A little more attention has been paid to fir timber owing to the continued high price of sawn pitch-pine, but the demand is very small. Oak has been selling rather more freely during the month, especially for the cheaper classes of timber.

Canadian Timber.—A little more progress has been possible in the realization of the better quality pine deals, but prices have only been maintained by patiently waiting for the demand. Spruce has not shown any sign of improvement in prices in spite of the small stock and the high cost of fresh supplies. The position of hardwoods is unchanged, but some shipments of birch timber from the lower ports have suffered in the prices realized, owing to the small enquiry for them. The market for sawn timber shows no change, but, if anything, there is a better enquiry on the spot. The wood has been offered for shipment rather more freely of late, as is usual at this season of the year, and the impression among buyers at one time was that prices would be lower. It is, however, being very clearly demonstrated that shippers at the Gulf Ports are not so dependent as

they formerly were on the European demand, the vast quantities required for home consumption and for South America making them somewhat independent. This demand, if it continues, should have a steadying effect on prices on this side, which will be very welcome to merchants who have suffered from the vagaries of this particular market for many years. Deals continue in request at high figures, and the supply is insignificant.

Hardwoods.

Teak.—Messrs. Denny, Mott & Dickson report that the landings in the docks in London during May consisted of 1,771 loads of logs and 383 loads of planks and scantlings, or a total of 2,154 loads, as against 1,465 loads for the corresponding month of last year. The deliveries into consumption were 314 loads of logs and 393 loads of planks and scantlings—together 707 loads, as against 561 loads for May, 1905. The stock remains practically on a level with the low stock of a year ago. The imports for the month show an increase of 700 loads on those for May, 1905; but out of this quantity nearly 500 loads were in Java timber, principally logs which have been coming forward too freely, and, owing in many cases to the indifferent quality and poor specification, fail to find buyers. The consumption showed some improvement upon the previous month, but still remains restricted, owing to the high prices of both logs and planks. The limited supplies at the shipping ports, however, cause shippers to decline business unless they obtain their full rates; and the consequence is that consumers only buy for their actual stock requirements. Messrs. C. Leary & Co. give the following quotations according to specification:—Timber £12 10s. to £19, flitches £19 to £20, planks £13 10s. to £19 10s. per load on c.i.f. terms.

Mahogany.—This market continues in a firm condition, small and inferior wood especially having appreciated in a marked degree, and good first-quality timber is firmly held.

Walnut.—In American black, sizeable logs of prime wood find interest at remunerative prices, but Italian and French sell slowly.

Odessa Oak.—Supplies coming forward are going direct into consumption, as buyers have practically purchased all the season's shipments of first-class logs, butts and wainscots.

OUR PLATE.

County Hall, Northallerton.

THE view represents the interior, from the public gallery, of the council-chamber of the new county hall at Northallerton, recently completed for the North Riding of Yorkshire County Council. The chamber is 45ft. square, and provides accommodation for seventy-two aldermen and councillors, as well as for the officials and reporters. The upper portions of the walls, together with the enriched cornices, coffered arches and domed ceilings, are of fibrous plaster. The dado is of Cuban mahogany; it is raised and richly carved on the wall behind the chairman. The seating is of Cuban mahogany upholstered in green morocco leather. Mr. Walter H. Brierley, F.S.A., of York, was the architect.

ABSTRACT OF STOCK, CONSUMPTION, &c., IN LONDON DOCKS, FOR MAY.

All Docks.	Deals (Fir).	Battens (Fir).	Pine.	Spruce.	Pitch-pine Deals.	Deals and Battens in Aggregate.	Rough Boards (All Countries).	Flooring.	Floated Timber.
	Pieces.	Pieces.	Pieces.	Pieces.	Pieces.	Pieces.	Pieces.	Pieces.	Loads.

Correspondence.

A National Architectural Record Society.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Through the columns of your paper may I suggest the formation of a National Architectural Record Society? This society would be divided into county groups, and each group divided into sections corresponding to the various Local Government divisions of each county, urban and rural. Furthermore, there should be a correspondent for each parish, if possible; if not, then for a group of parishes; the whole to be united under the London group.

The object of the society would be the cataloguing of all books, articles, pamphlets, engravings, maps, plans, diagrams, measured drawings, &c., referring to streets, buildings, &c., still in existence or that have disappeared; the collection of measured drawings, plans, photographs, and, to this end, the supplying of information in regard to all ancient buildings within the jurisdiction of each group, especially to those desirous of making measured drawings of buildings within that district; the giving of lectures on architecture generally, in connection with university extension or otherwise; and the organization of visits to interesting buildings. There should also be published a year-book of the whole society, giving the names of all officers, reports of the work done by the various groups, details of work needed to be done or measured, and so on.

I shall be most happy to hear from any of your readers who would be willing to co-operate with me in endeavouring to found such a society, and especially from those who would consent to act as local secretaries *pro tem*.

I am daily experiencing the need of such a body, if only for the purpose of reference and gathering information. It could carry on the work the result of which we see in that splendid little book—the "Handbook of English Ecclesiology." In this way complete catalogues of the existence of rare examples could be made once for all.

The need of such a society is shown by the continual publication of enquiries in your columns as to what churches, &c., are worth measuring in or near such and such a place. What becomes of all these measured drawings? Some at least of them must be of value. Would not the students who make them be willing to leave copies of their work on the spot, or elsewhere where they would not be lost sight of or forgotten? How many subjects have been measured over and over again and other valuable bits overlooked and left severely alone?

Again, could it not be possible for architects who have restored or altered old houses or churches to let copies of their drawings be preserved on the spot, so that the original state, at least before the last alteration or addition was made, could be seen?—Yours truly,

(REV.) ROBERT A. DAVIS.

BROXWOOD, PEMBRIDGE, R.S.O.,
HEREFORDSHIRE.

Hot-water and Heating Services.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—I am instructed by my Council to communicate with you and respectfully draw your attention to the action of the plumbing trade (both masters and operatives) in interfering with the execution of contracts placed in the hands of heating and domestic engineers by architects and other clients, and to the attempts of the plumbers to secure a monopoly of the work of domestic hot-water supply.

The plumbers' claims, which have been made in various places throughout the

country, are that all such work in any metal is plumbers' work only, and that it must not be undertaken by heating and domestic engineers. These claims have been successfully resisted, although in some cases the plumbers struck work and caused serious loss and annoyance to all concerned.

This class of work has always been largely carried out by heating and domestic engineers, and the experience of some firms (members of this Association) covers a period of over eighty years. The claims of the plumbers are of quite recent date, and cannot be admitted, as, if acceded to, the monopoly created would be a hardship and injustice not only to the master engineers but also to the workmen engaged in this special branch of engineering, who by training and experience are thoroughly qualified to do the work in the most efficient and satisfactory manner.

The annexed resolution (Appendix No. 1), which was adopted at a joint conference between representatives of both master engineers and master plumbers, expresses the general position taken up and maintained by the members of this Association.

I am further to advise that, with the object of preventing trouble and giving correct information as to facts, my Council submitted representations to the Royal Institute of British Architects, and an extract from a letter conveying the decision of this body is also annexed (Appendix No. 2). This, you will observe, is strictly neutral and impartial, and gives no support to the plumbers' claims for a monopoly.

As repeated assertions have been made by the plumbers that the Manchester Society of Architects agree that the work in question is plumbers' work only, I further annex (Appendix No. 3) copy of a letter received from this Society which makes it clear that their position is the same as that of the R.I.B.A.

My Council desire me to ask your kind and careful consideration of this matter and the favour of your co-operation, and I am to say that any communication from you will receive the best attention, and further information can be supplied if required.—Yours truly,

H. B. WATT, Secretary,
National Association of Master Heating
and Domestic Engineers.

12, GREAT JAMES STREET,
BEDFORD ROW, W.C.

APPENDIX NO. 1.

Joint Resolution of Master Engineers and Master Plumbers.

"At a meeting held May 22nd, 1902, it was mutually resolved by the representatives of the National Association of Master Plumbers of Great Britain and Ireland and the Institution of Heating and Ventilating Engineers that in future it be observed that all lead work be considered plumbers' work, and that a neutral line be taken as regards all iron, brass, copper or other metal-work which may be executed by engineers or plumbers."

Proposed by Mr. D. M. Nesbit, London, on behalf of the Institution of Heating and Ventilating Engineers; seconded by Mr. J. H. Taylot, Huddersfield, on behalf of the National Association of Master Plumbers, and unanimously agreed to.

APPENDIX NO. 2.

Extract from Letter from the Royal Institute of British Architects to the National Association of Master Heating and Domestic Engineers.

"27th February, 1906.
"I am directed by the Council to inform you that the Committee appointed to receive deputations from the National Association of Master Plumbers of Great Britain and Ireland, the National Association of Master Heating and Domestic Engineers, and the United Operative Plumbers' Association, with regard to the right of the different trades to deal with hot-water work for heating and hot-water supply, has presented its report, with which the Council is in entire agreement."

"I am to inform you that the Royal Institute of British Architects is concerned only with the improvement and efficiency of craftsmanship, and does not concern itself with trade questions. It therefore cannot see its way to lay down any rule or to advise its members as to which trade should have the right or preference in the execution of hot-water work."

"(Signed) W. J. LOCKE,
"Secretary."

APPENDIX NO. 3.

Copy of Letter from the Manchester Society of Architects to the National Association of Master Heating and Domestic Engineers.

"16th March, 1906.
"With reference to the circular issued by the Master and Operative Plumbers' Associations, dated March 25th, 1903, which emanated from this Society, my Council

regrets to hear that it has not been construed in the spirit intended."

"I am instructed by my Council to inform you that it is in complete accord with the letter, copy of which I enclose, issued from the Royal Institute of British Architects, dated 27th February, 1906, and to inform you that it desires the same to be accepted as its view of the matter."

"(Signed) PAUL OGDEN,
"Honorary Secretary."

King's Norton School Competition.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—In this case the school consists of three separate one-storey buildings. The infants' school, given in your issue for May 30th (p. 287), might have some excuse had it had unavoidably to follow the lines of a boys' or girls' school placed above; but, being a one-storey building, its plan gives no indication of being an infants' school, except that of having classrooms of smaller dimensions. It is necessary to point this out in order to prevent future assumption that the plan represents a first-rate arrangement for infant teaching.—Yours truly, E. R. ROBSON.

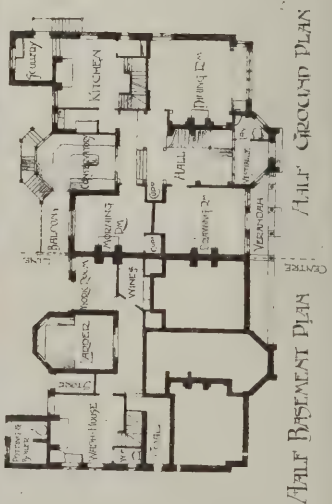

9, BRIDGE STREET, WESTMINSTER.

Law Cases.

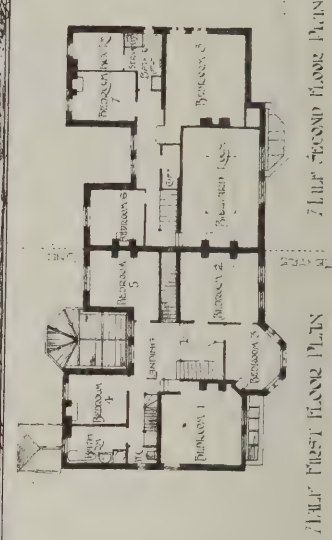

A Building Line Case at Birmingham.—

At King's Heath, Birmingham, recently the King's Norton and Northfield Urban District Council summoned Mr. S. J. Roberts, builder, of Moseley, for exceeding the building line without the consent of the authorities. The defendant erected some shops in High Street, King's Heath, and consent was given by the Building Committee to bring the bay windows 5ins. beyond those of the next premises, the property of Mr. Grant. It appeared that the plan deposited and sanctioned was incorrect. The plan showed Mr. Grant's bay windows adjoining projected 1ft. 1in. The Committee allowed defendant 5ins., making 1ft. 6ins. As a matter of fact, the line of Mr. Grant's bay only projected 7ins., and it was alleged the total projection was 1ft. 11ins. A large amount of correspondence had taken place, and the defendant admitted a mistake of 2ins. caused by an error of the joiner.—The Bench considered defendant had committed an offence under the Act, and fined him 1d. a day from February 14th to May 25th, since the notice of the Council was sent, ordering him to carry out the necessary alterations and pay the legal costs of the prosecution. They also intimated that unless the work was carried out within a month the full penalty of 40s. would be imposed for every day the encroachment was in existence.

By-laws as to Party-walls.—At the Southampton Borough Police Court recently the hearing took place of ten summonses against Mr. John Smith, builder, respecting party-walls between ten houses in Thornbury Road, the party-wall being so constructed as to exceed 32ft. in length and not 13ins. thick below the topmost storey, as required by section 24 (a) of the by-laws. For the defence, Mr. Ensor stated that similar plans to those in question had been before the Council and approved. Defendant had put in cross-walls which had been approved by the committee as substantially meeting their requirements, and he should not be prosecuted in May when the same plans were approved in December. Mr. W. Burrough Hill stated that the by-laws did not contemplate the extra support afforded in this case, and he often got concessions from the Corporation when equal strength was shown. The wall, as it existed now, was stronger than if it had been carried out within the strict letter of the by-law. The Bench imposed a penalty of £5 and costs in respect of the one house completed, and being advised as to the desirable amendment of the by-law, the town clerk withdrew all the other summonses, saying he would convey to the Works Committee the opinion of the Bench.

Inquiries Answered.

Questions should in all cases be addressed to the Editor and be written on one side of the paper only.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters.

Correspondents are particularly requested to be as brief as possible.

The querist's name and address must always be given, not necessarily for publication.

Architectural Department, Board of Education.

BRIXTON.—EDUCATION writes: "How can I obtain an appointment in the Architectural Department of the Board of Education, and where should I apply?"

The architectural staff of the Board of Education consists nominally of only one architect, who actually has one assistant. It is quite impossible, therefore, to obtain an appointment as architect in this department.

H. Y. M.

Surveyors for Canada.

DERBY.—W. B. writes: "Referring to the enquiry under this head on p. 250 of your issue for May 9th, having a great desire to get on a big survey company, I should be glad if you could give me further particulars regarding same. Perhaps you could also inform me to whom I should write for more detailed particulars."

X. writes: "In your issue for May 9th, in answer to an enquiry by 'Cinque Port,' you say it is possible to work up for an appointment as surveyor under the Government while acting as a draughtsman in Canada. From whom can I get particulars?"

We presume our first correspondent refers to the surveying parties which are formed in the spring, and start out when the ice breaks up. These parties consist of about six men when small, and from ten to twelve when large. They comprise the surveyor, a clerk to take down notes, measurements, &c., men to carry the chains for measuring, axe men who cut down the undergrowth and clear a path, mound diggers who pile up the earth to take the permanent surveying posts, and dig the holes at the north, south, east and west corners, which is the form the stations take; a cook and a teamster. The wages of these assistants are about two dollars per day, with keep. Several of these parties go out in the spring from Winnipeg, and the way to join them is to become acquainted with the surveyor, and show to his satisfaction that you are capable of undertaking the work. Replying to both our correspondents we would say particulars can be obtained from several sources, but we can only remember at the moment Mr. J. F. Robinson, Departmental Commissioner, Public Works Department, Regina, Saskatchewan. Further particulars can also be obtained from the professional handbook issued by the Emigrants' Information Office, 31, Broadway, Westminster.

Fuming Oak.

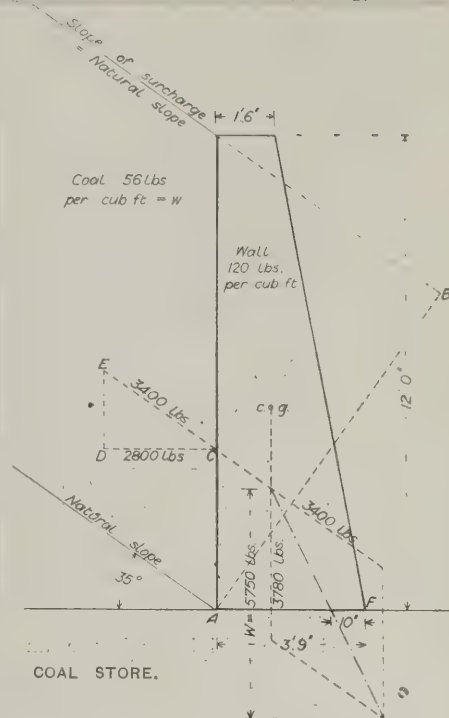

CHESTER.—J. M. writes: "Which is the most efficient and cheapest way to fume oak? Please describe the process fully."

The best way to fumigate oak is with ammonia. The process is fully described on p. 392 of our issue for December 19th, 1900. The work is put in a small cupboard or room and there exposed to the fumes. With a room about 12ft. square and 8½ft. high, packed pretty full of oak joinery, three Winchester's of liquid ammonia fort. 0.880 would be allowed, and the fumigation would be completed in twenty-four hours.

Coal Store.

LONDON.—A. S. D. writes: "The accompanying sketch shows a coal store. Please give formulæ for finding (1) the pressure of the coal on the walls when the store is filled, as shown, 12ft. against walls; (2) thickness of brick walls to resist that pressure—(a) brickwork in mortar, (b) brickwork in cement."

There are so many points to be attended to in designing coal stores that they should be left to experts. The thrust from the coal against the side walls will be the same as if the wall were a surcharged retaining wall as shown by the accompanying illustration, but it is not usual to rely upon the stability of an unsupported wall. Tie bolts are inserted at intervals between the two sides, and then walls of parallel thickness are used. The roof adds weight and therefore stability to the walls, but no particulars are given. Taken as an unsupported retaining wall, the method of working will be as follows:—From A, the inner edge of base, set out the angle CAB equal to the natural slope, and produce AB to meet the slope of surcharge produced in B. Then the horizontal pressure on the back of the wall at c, which is one-third of the height, will be $\frac{1}{2} w (AB)^2 = \frac{1}{2} \times 56 \times 10^2 = 2,800$ lbs. Next from c draw CE parallel to the natural slope to meet a vertical from D in E, giving EC as the thrust at back of wall. This thrust must now be combined with the weight of wall as shown, the

resultant cutting the base AF joins. from the outer edge F, and having the vertical component 5,750 lbs. The stability can be checked by the formula $\frac{2}{3} \cdot \frac{W}{d} = \frac{2 \times 5750}{3 \times 0.83} = 4,600$ lbs., or, say, 2½ tons per sq. ft., which is well within safe limits.

HENRY ADAMS.

Proportions and Stability of Hall.

ENQUIRER writes: "I should be glad of a further explanation of the answer to the enquiry about the proportion and stability of a hall on p. 211 of your issue for April 18th last. Does Professor Adams mean that the pressure of wind on the side walls of a two-storey building with 14in. walls will necessitate extra piers under each principal? If these are absolutely necessary, half the buildings of this class are unstable, yet many have stood the wind in exposed situations for years. I should also like to call your attention to the need of a tabulated list of the scantlings of moderate-sized wooden roof principals, say up to 50ft. span, other than the king- or queen-post type. For instance, the school or German truss, the collar beam with and without arched rib, hammer beam, and others similar, have never been dealt with in a scientific and systematic manner, so far as I know. These tables could be published in the form of a card to be hung up for reference, and the strengths in oak, pitch-pine and fir given: also a table of sizes of hip rafters might be included. Some of our professors might deal with a matter of this sort, but I am afraid it is too practical and commonplace to interest them."

I think you are labouring under some misapprehension. The case in question is not a simple "two-storey building with 14in. side walls"; it is a public building of two floors with a clear roof-span of 35ft. and a height of probably the same amount, so that strong piers under each principal are absolutely necessary.

HENRY ADAMS.

Moment of Inertia for Rolled Joist.

HARLESDEN.—N. K. writes: "In your issue for November 22nd, 1905, p. 302, the greatest and least moments of inertia are given for a 12in. by 6in. by 54 lb. rolled steel joist as 369'91 and 31'43 respectively. I can work out the former from the formula

$$I = \frac{bd^3 - h^3(b-t)}{12}$$

given in your issue of November 8th, 1905,

p. 265; but I cannot find a formula for the latter, where the neutral axis passes through the centre line of the web. Kindly give same with the working out, to show how the 31.43 is obtained?"

The rolled joist being taken as in Fig. 1,

Fig. 1

Fig. 2

the simplified form will be as Fig. 2, and the least moment of inertia will be

$$I = \frac{2bh^3 + bd^3}{12} = \frac{2 \times .875 \times 6^3 + 10.25 \times .5^3}{12} = \frac{378 + 1.28}{12} = 31.6.$$

The difference between this and the 31.43 quoted is due to the corners of the flanges having been taken as square.

HENRY ADAMS.

Bent Joist to Carry Roof.

TEDDINGTON.—STRUCTURE writes: "I send tracing of a rolled steel joist for carrying the timbers of a tiled roof. The loads are distributed as shown. I estimate that the section at loads A B and C D should be 8 in. by 5 in. r.s.j. and at load B C 10 in. by 5 in. r.s.j., or their equivalents. It is proposed to use a 12 in. by 5 in. by 39 lb. r.s.j. Would this be strong enough? The wall is 14 ins. thick, and no piers or buttresses are to be used. How is the strength of the beam determined so that there will be no movement of the shoe on the stone template tending to overturn the wall? No tie rods are to be used."

The rolled joist, Fig. 1, may be calculated as a straight beam with the loads as shown in Fig. 2. The loading being symmetrical, the reactions at A and B will each be $\frac{2+2+2}{2} = 3$ tons, assuming that the joint

plate at B is insufficient to make it a continuous girder. The bending moment at C will be $3 \times 4.5 = 13.5$ ton-ft., at D $3(4.5 + 4.75) - 2(4.75) = 27.75 - 9.5 = 18.25$ ton-ft.,

and at E $3(4.5 + 4.75 + 4.75) - 2(4.75 + 4.75) = 42 - 19 - 9.5 = 13.5$ ton-ft., as at C. The maximum bending moment in this case being 18.25 ton-ft., and the maximum bending moment for a distributed load being $\frac{WL}{8}$, we have $\frac{WL}{8} = 18.25$, whence $WL = 8 \times 18.25$; but $L = 18.5$ ft., therefore $w = \frac{8 \times 18.25}{18.5} = 7.89$, say 8 tons, equivalent load distributed uniformly over 18 ft. 6 ins. span, for which a 12 in. by 5 in. by 39 lb. rolled steel joist will be ample. As the rolled joist cannot be bent to the shape required at C, it must be cut and strongly connected by $\frac{1}{2}$ in. plates carefully fitted on each side of the web.

HENRY ADAMS.

A TENNIS COURT.

A NEW royal tennis court has recently been built at Moreton Morell, $6\frac{1}{2}$ miles from Leamington, and as it embodies features which are somewhat novel we publish the following particulars:—The exterior is of red brick with stone dressings relieved with panels of grey rough-cast. The frontage of the court is 120 ft. and the depth 55 ft. The tennis court towers above the front buildings, the centres of which break forward, and in between is situated the squash racket court. The vestibule, saloon, dedans and lounge are three steps above the court floor level, and command a good view of the play. The squash racket court is a reproduction of the Tuxedo court near New York, and is lined with wood, both walls and floor; a small gallery for spectators, 4 ft. above the floor, being furnished, with a net to stop the balls coming through the opening, 10 ft. by 5 ft.; above this is another gallery fitted along the front with a massive turned balustrade. The walls of the tennis court are black (Bickley's patent); an oak polished moulding forms the play line, above which is cement-work jointed and stained a bright buff colour. Surmounting all is an elaborate cornice and frieze filling the angle all around the court and following the slope of the roof, the underside of which is covered with a fine white plaster on expanded steel lathing which reflects a clean light down on the floor; the light-coloured walls above the playline also reflect light down about the floor. The bright red floor does not kill the ample light like a black floor; indeed, this combination of arrangements make the light in the court a surprise to tennis players. The side windows and the skylight admit an abundance of light without any glare. The side windows are managed from an outside gallery; thus no unsightly blinds or cords are required. The professionals' residence con-

sists of a suite of rooms at the opposite end to the entrance, while the space behind the pent house and grill is fitted up as a workshop for the marker. The heating is from a stokery underneath the marker's quarter, where there are three distinct boilers, a large one to heat the two courts, one for radiators and one for baths. Electric light is installed throughout. The work was entrusted to Mr. Joseph Bickley, of 62, Lillie Road, London, S.W., who has earned an excellent reputation in the way of designing and equipping tennis and racket courts.

MANCHESTER NOTES.

Proposed New Town Hall for Salford.

A sub-committee appointed by the Salford Corporation to consider the inadequacy of the present town hall, and the need for better accommodation for the various departments now housed in several adjacent buildings, has come to the conclusion that any practicable extension of the present building would be, at best, but a temporary and costly expedient. The sub-committee therefore "thinks it would be wiser to provide a new town hall adequate to the present needs of the borough, and to provide for the reasonable requirements of the future." The committee suggests the erection of a new town hall in Peel Park, which, they think, would not cost more than £70,000. The old building could then be used for the less important departments. A meeting of the Town Hall and Markets Committee will shortly be held to discuss this report, and an inspection of the proposed site in Peel Park will be made.

Stone for Manchester Infirmary.

The Bath Stone Firms, Ltd., has secured the contract for Portland stone for the superstructure of the new Manchester Infirmary. About 10,000 tons, or 160,000 cub. ft., will be required, which will necessitate a cargo a week for twelve months. The contractors, Messrs. H. Arnold & Sons, will work the stone on the site, and about 400 or 500 men will be employed.

State of Building Trade.

On the whole the building trade in Manchester and neighbourhood shows a welcome improvement, though some firms are still short of work. Many architects report a good number of contracts in hand, schools and libraries forming no inconsiderable proportion of the work.

Alterations in Lancashire Towns.

Architecturally the Lancashire manufacturing towns are more notorious than famous, and in truth any beauty they have possessed has been generally of the severely utilitarian type. Most of the towns can boast of one or two good churches, some of fine town halls, but the prevailing appearance is usually black and monotonous, sometimes even squalid. Within the last six or eight years, however, considerable changes have been made. Banks, brewers and education committees have erected substantial and well-designed premises; libraries and art galleries have sprung up amongst the small property inhabited by the cotton operatives, and shop-fitters have revolutionized many streets. Bury, Rochdale, Bolton, Blackburn and Accrington are cases in point, and in Warrington the change is even more pronounced. Unlike most of the places named, Warrington is essentially an ancient town. It is mentioned in the Domesday Survey. The streets, therefore, are often narrow and tortuous. Now its main thoroughfare is being widened and old timbered and thatched buildings on both sides are giving way to frontages of terracotta and polished granite. The next few years will see a good deal of rebuilding in this smoky town.

(Note This scheme has been modified in execution.)

Complete List of Contracs Open.

With a few exceptions, news of Contracts Open are not repeated after they have been published once in these columns, so that readers will find particulars in our previous issues of other contracts that still remain open.

Unless expressly stated to the contrary all deposits required for bills of quantities, &c., are returned on receipt of bona-fide tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair-wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

June 15. Kirkcaldy.—Alterations on the platform at Pathhead Public Hall. The plan may be seen and copies of the specification obtained upon application at the Burgh Surveyor's Office. Tenders to be left with W. L. Macindoe, town clerk, Town Clerk's Office, Kirkcaldy, not later than June 15.

June 15. Turnbridge.—Mason's, bricklayer's, joiner's, plumber's, slater's, painter's, concrete's, iron and steel founder's, and patent glazier's works required in the erection of a mill shed at Turnbridge. Plans may be seen and quantities obtained at the offices of Lunn & Kaye, architects and surveyors, Huddersfield, to whom tenders are to be sent free of charge by June 15.

June 15. Shirley.—Erecting a foresters' hall at Park Street, Shirley. The competition will be confined to builders residing in the county borough of Southampton. Plans and specifications may be seen and the bill of quantities obtained on payment of a deposit of £2 2s., on application to H. J. Weston, architect, 24, Portland Street, Southampton. Sealed tenders, endorsed "Tender, Foresters' Hall," to be delivered to Henry R. Hale, secy., Court Windsor Castle, No. 1858, A.O.F., 14, Andover Road, Freemantle, Southampton, by 4 p.m. on June 15.

June 15. Colinton.—Mason, carpenter and joiner, plumber, slater and plaster works in connection with the addition proposed to be made to the cottage at Torduff, Colinton. Schedules of quantities may be had on application to C. C. Carse, architect, 37, Frederick Street, Edinburgh, at whose office plans of the proposed addition may be seen. Tenders, endorsed "Torduff, Cottage, Colinton," must be lodged with William Boyd, W.S., clerk to the Trust, Water Trust Offices, 12, St. Giles Street, Edinburgh, not later than 10 a.m. on June 15.

June 15. Cockenzie.—Alterations and additions to Cockenzie school, for the School Board of Tranent. The whole work is to be done under one contract, and the contractor will be bound to carry it through within a short specified time, which will be strictly enforced. Schedules of quantities will be supplied on application to Lyle & Constable, architects, 3, Hill Street, Edinburgh, and at Musselburgh, on or before June 15.

June 16. Penzance.—Alterations to stores in Jennings Street. Plans and specification may be seen on application to R. J. Chappell, of 48, Chapel Street, Penzance, to whom sealed endorsed tenders must be sent not later than June 16. A further particulars may be had of N. C. Whear, jun., architect, Penzance.

June 16. Truro.—Work at Gylval Trythall Council School, for the Cornwall Education Committee, including the erection of lavatory, &c., according to plans and specification, which may be seen at the school or at the office of Sampson Hill, architect to the Committee, Green Lane, Redruth, from whom all particulars relating to the work may be obtained. Forms upon which all tenders must be made may be had from the architect or at the school. Sealed endorsed tenders to be sent to F. R. Pascoe, secy., Education Office, Truro, on or before June 16.

June 16. Pannal.—Erection of a villa residence at Pannal, for G. E. Dixon. Plans may be seen and quantities obtained at the offices of John E. Stocks, architect, Greek Street Chambers, Park Row, Leeds. Tenders to be lodged not later than noon on June 16.

June 16. Camborne.—Rebuilding business premises at Camborne, for Henry H. Berriman, according to plans and specifications, which may be seen (by appointment) at the office of Sampson Hill, architect, Green Lane, Redruth, or at the Proprietor's residence, Chapel Street, Camborne, where sealed endorsed tenders are to be sent not later than 10 a.m. on June 16.

June 16. Lancaster.—Erection and completion of new branch store at Lancaster, co. Durham (including three shops, warehouse, manager's house, stabling, &c.), for the Annfield Plain Industrial Co-operative Society, Ltd. Drawings, specifications and conditions of contract may be seen and forms of tender obtained at the Architect's Office, 22, Durham Road, Black Hill, co. Durham. Tenders to be sent in to W. R. Pigg, secy., Co-operative Store, Annfield Plain, R.S.O., endorsed "Tender for New Branch Store at Lancaster," on or before June 16.

June 16. Southampton.—Provision of a cookery centre, Portswood School, together with the necessary furniture for same; certain alterations at Northam School. Plans and specification may be seen at the offices of the Borough Engineer and bills of quantity obtained on production of the Borough Treasurer's receipt for £1 ts. for each work. Tenders, endorsed "Portswood Cookery Centre" or "Northam School Alterations," to be forwarded to J. Cruickshank, secy., Education Offices, Southampton, not later than June 16.

June 18. Woodbridge.—Erection and completion of a Masonic Hall, New Street, Woodbridge. Plans and specification can be seen at the office of H. J. Wright, architect, 4, Museum Street, Ipswich, between 10 a.m. and 4 p.m., Saturday 10 to 1, when quantities can be obtained upon the deposit of a cheque for £2 2s. Tenders, sealed and endorsed, to be delivered to George Booth, jun., Church Street, Woodbridge, not later than 5 p.m. on June 18.

June 18. Wellington.—Completion of All Saints' Church by the erection of a tower with spire. The plans and specification may be inspected in the vestry between 9 a.m. and 6 p.m. until June 16. Bills of quantities may be obtained at the office of the architect, J. Houghton Spencer, 5, Hammet Street, Taunton, and sealed tenders should be addressed to him, and endorsed "All Saints Church Building Tender," not later than Monday, June 18.

June 18. Colwyn Bay.—Erection of a new county police-station and magisterial quarters in Colwyn Bay. Builders desirous of tendering are requested to forward their names, together with a deposit of £1 ts., to the county architect and surveyor, Walter D. Wiles, 42A, High Street, Wrexham, on or before June 18.

June 18. Ynysddu.—Alterations and extensions to the school. Plans and specifications may be seen at the office of R. L. Roberts, M.S.A., Abercarn, and bills of quantities obtained on payment of £2 2s. Sealed tenders, endorsed outside "Ynysddu School Extensions," are to be delivered to C. Dauncey, County Council Offices, Newport, Mon., not later than June 18.

June 18. Colchester.—Extension of the tram car shed, Magdalen Street. Plans, specifications, bills of quantities, &c., may be obtained upon application at the office of Herbert Goodyear, A.M.I.C.E., borough engineer, Town Hall, Colchester, to whom sealed tenders, endorsed "Extension of Tram Car Shed," are to be delivered not later than June 18.

June 19. Durham.—Alterations to Springwell Council School. Plans, specifications and conditions of contract may be seen at the school and at the Architect's Office. Quantities may be obtained on application to the architect, W. Rushworth, F.R.I.B.A., architect, County Education Offices, Durham, to whom sealed and endorsed tenders are to be delivered by June 19.

June 19. Plymouth.—Erection and completion of a chapel at the New Cemetery, Egg Buckland, for the Plymouth Borough Council, in accordance with the plans, drawings and specifications, which can be seen and forms of tender and bills of quantities obtained on receipt of a deposit of £2 in cash. Sealed tenders, accompanied by the fully priced out bills of quantities, are to be deposited at the offices of James Paton, borough engineer and surveyor, Municipal Offices, Plymouth, not later than 5 p.m. on June 19.

June 20. New Fryston.—Erection of a signal cabin at Fryston South, situate near New Fryston village, midway between Castleford and Burton Salmon, for the North Eastern Railway. Plans, specification, quantities, and indenture may be seen at the office of the Company's engineer, W. J. Cudworth, at York, where detailed quantities and form of tender may be obtained on personal application. Sealed tenders marked "Tender for Signal cabin at Fryston South," to be sent to the engineer, W. J. Cudworth, at York, not later than June 20.

June 20. Sandwith.—Enlargement of Sandwith Council Schools. Plans and specifications can be seen at the schools on application to the caretaker, Mrs. Parker, Townend, Sandwith. Separate and full tenders, sealed and endorsed, to be delivered to C. C. Hodgson, Cumberland Education Committee, The Courts, Carlisle, on or before June 20.

June 20. Ramsey.—Erection of proposed new school buildings for the Governors of Ramsey Grammar School. Plans and specification can be seen at the County Surveyor's Office, 36, High Street, Huntingdon, and quantities obtained on payment of £2 2s. Tenders to be sent in to P. L. Rogers, clerk to the Governors, Ramsey, Hunts, not later than June 20.

June 20. London.—Erection of extension buildings to the new Hampstead General Hospital at Haverstock Hill. The drawings, specification, condition of contract, form of contract and form of bond can be inspected and the bills of quantities and form of tender obtained at the offices of the architects, Young & Hall, 17, Southampton Street, Bloomsbury, W.C., between 10 and 4, upon depositing the sum of £5. Tenders (which will be received and considered only on the printed form, which must not be varied) must be enclosed in the printed envelope supplied for the purpose. Priced bills of quantities, under separate cover, and sealed in the printed envelopes provided, must accompany the tender. The Committee reserve to themselves the right to open these quantities, with a view to considering any tender, and before the acceptance of same, otherwise they will be returned unopened. Both tender and priced bills of quantities are to be delivered at the hospital not later than noon on June 20.

June 20. Lochboisdale.—Mason, carpenter, slater, plumber and plasterworks for manse at Lochboisdale, South Uist. Plans and specifications can be seen with MacLennan, merchant, Lochboisdale, who will receive offers up to June 20.

June 21. Swansea.—Building a new church at Port Tennant, Swansea, for the Rev. W. Evans. The plans and specification can be seen and quantities obtained on deposit of £2 2s. at the office of E. M. Bruce Vaughan, F.R.I.B.A., 21, Dumfries Place, Cardiff, to whom tenders must be sent by June 21.

June 21. Leeds.—Proposed Secondary School, Whin gate, Armley. Contractors desirous of tendering are requested to send in their names to W. S. Braithwaite, Architect's Department, Education Offices, Leeds. The notification of a desire to tender should be accompanied by a deposit of £1 ts. Tenders, endorsed "Tender for Secondary School, Armley," are to be sent in to James Graham, secretary for Higher Education, Education Offices, Leeds, not later than 10 a.m. on June 21.

June 21. London, E.C.—New fog signal house, dwelling, &c., on Flat-holm Island, near Cardiff, for Trinity House, E.C. The plans may be inspected and forms of tender and specifications obtained either at Trinity House between 10 a.m. and 5 p.m., or on application to the Officer-in-charge, Trinity Store, Cardiff. Applicants when receiving a form of tender and specification will be required to deposit one pound (£1), on producing the receipt for which at the offices of Corderoy, Selby & Corderoy, 21, Queen Anne's Gate, London, S.W., they may obtain the Surveyor's quantities in connection with the work. Tenders, sealed and marked outside "Tender for new Fog Signal House, &c., Flat-holm," must be addressed to A. Owen, secy., and delivered at Trinity House on or before June 21, and no tender can be entertained that is not made on the forms provided.

June 21. Port Isaac.—Alterations to boys' and girls' hat and cloak rooms, at the Council School, according to plan and specification, which may be seen at the Council Schools, Port Isaac, or at the office of B. C. Andrew, architect to the committee, Biddick's Court, St. Austell. Forms upon which all tenders must be made may be had from the architect or the secretary. Sealed endorsed tenders to be sent to F. R. Pascoe, secy., Education Office, Truro, on or before June 21.

June 21. Whitcross.—Erecting a new shelter at Whitcross Council School according to the plan and specification which may be seen at the Council Schools, Whitcross, or at the office of B. C. Andrew, architect to the committee, Biddick's Court, St. Austell. Forms upon which all tenders must be made may be had from the architect or the secretary. Sealed endorsed tenders are to be sent to F. R. Pascoe, secretary, Education Office, Truro, on or before June 24.

June 21. Barry.—Building a new church at Barry for the Rev. H. H. Stewart. The plans and specification can be seen and quantities obtained at the office of E. M. Bruce Vaughan, F.R.I.B.A., 21, Dumfries Place, Cardiff. A deposit of £2 2s. must be made. The tenders are to be sent to the architect not later than June 21.

June 21. Darlington.—Erection of a manual instruction school at Corporation Road; also for large additions and alterations to the Gurney Pease Schools, Albert Hill. Plans and specification may be seen and bill of quantities and form of tender obtained at the offices of George Winter, borough surveyor and waterworks engineer, Town Hall, on depositing a cheque for £2 2s. Tenders, endorsed "Schools," must be sent to H. G. Stevenson, town clerk, Darlington, not later than noon on June 21.

June 21. Caerphilly.—Erection of forty cottages at Caerphilly, for the Castle Building Club. Plans and specification can be seen at the offices of A. O. Evans Williams & Evans, architects, Pontypridd, to whom tenders are to be sent by June 21.

June 21. Shipley.—Erection of a vicarage house for the parish of St. Paul, Shipley. Plans may be seen and bills of quantities obtained at the offices of S. H. & F. Healey, architects, 42, Tyrryl Street, Bradford, up to June 21, on which date the tenders are to be sent in.

June 21. Trealew.—Alteration and conversion of the old Trealew Schools into a school for girls and infants. Plans and specification may be seen and bills of quantities obtained at the office of the architect, Jacob Rees, Hillside Cottage, Pentre, on the deposit of £2 2s. which will be returned on receipt of a bona-fide tender. Tenders must be made out upon the form of the Council, a copy of which may be had from the Architect at the above address. Sealed tenders, endorsed "Tender for Trealew Schools," accompanied by the priced quantities, must reach T. W. Berry, Director of Education, Council Offices, Pentre, Rhondda, on or before June 21.

June 22. Salisbury.—Alterations to the operation ward at the Infirmary, the plans and specifications of which can be seen at the offices of the architects, John Harding & Son, 58, High Street, Salisbury. Tenders to be delivered to S. Buchanan Smith, secy., Crown Chambers, Salisbury, before 4 p.m. on June 22.

June 22. Holywell.—Alterations and extensions to the County Intermediate School, Holywell, in the county of Flint. Plans and specifications may be seen at the offices of the architect, Samuel Evans, North and South Wales Bank Buildings, High Street, Mold, from whom bills of quantities may be obtained on payment of a sum of £2 2s. Tenders to be made out on forms to be supplied and sent in to F. Llewellyn-Jones, solicitor, clerk to the Holywell County School Governors, Town Hall, Holywell, North Wales, on or before June 22, in sealed envelopes, marked "Tenders for Extensions at Holywell County School."

June 23. Gillingham.—Erection of a new school at Hempstead, Gillingham, to accommodate seventy-six children. Drawings, specification and conditions of contract may be seen on application to Charles H. Langley, 66, Gillingham Road, Gillingham. Bills of quantities and form of tender may be had on payment of £1 ts.

The time to be allowed for erecting the building is four months. Tenders, duly endorsed, must be delivered to E. T. Atchison, secty., 8, Waterloo Road, Gillingham, Kent, before noon on June 23.

June 23. Shrewsbury.—Erection of wooden buildings, stages, &c., for the Shropshire Horticultural Society's annual show in August. Plans and specification will be supplied on application to Walter Richards, Swan Hill, Shrewsbury, on payment of £1 1s. The work will be divided as follows:—(1) Buildings and boardings; (2) horse track, stages and fittings; (3) draining; (4) plumbing. Tenders will be received for any or all sections, and must be sent in by June 23 next, addressed "Chairman of Committee," endorsed "Tender for Erections," to the care of Adnitt & Nanton, hon. secs., The Square, Shrewsbury.

June 25. Barnsley.—Erection of three elementary schools, to accommodate 360, 300 and 360 scholars respectively, on a site in Racecourse Road, Barnsley. Applications, together with a deposit of £2 2s., to be made to the architect, Ernest W. Dyson, 14, Market Hill, Barnsley, not later than June 25. Fair wages clause.

June 25. Sevenoaks.—Erection of an isolation hospital at Otford, Sevenoaks, Kent, for the R.D.C. The drawings, specifications, and conditions of contract, prepared by the architect, M. Maberly Smith, can be seen at the offices of Cleed & Belcher, of 8 and 9, Martin's Lane, Cannon Street, E.C., to whom intending competitors are requested to send in their names before June 15, and from whom bills of quantities, together with forms of tender, can be obtained on and after June 20, on payment of £2. Tenders are to be delivered before noon on June 25, at the office of George F. Carnell, clerk, 130, High Street, Sevenoaks.

June 26. Stanleytown.—Erection of three houses and vestry at Stanleytown, Rhondda Valley, for the Trustees of the Welsh Calvinistic Methodist Chapel, Pontygaith. Plans and specification may be seen with William Williams, grocer, Cash Stores, Pontygaith, to whom sealed and endorsed tenders are to be delivered before 5 p.m. on June 26.

June 26. Wrexham.—Erection of a new post-office at Wrexham. Drawings, specification, and a copy of the conditions and form of contract may be seen on application to the postmaster between 10 a.m. and 5 p.m. Bills of quantities and forms of tender may be obtained at the Office of Works, on payment of £1 1s. Tenders must be delivered before noon on June 26, addressed to the Secretary, H.M. Office of Works, &c., Storey's Gate, London, S.W., and endorsed "Tender for New Post Office, Wrexham."

June 26. London, S.W.—Erecting a public elementary school to accommodate 840 children on a site in Fountain Road, Tooting, S.W., for the London County Council. Persons desiring to submit tenders may inspect the drawings, form of tender, and obtain the bills of quantities, of form of tender, and other particulars at the Education Offices (Architect's Department), Victoria Embankment, W.C., upon payment to the cashier of the sum of £5. Tenders must be upon the official forms, and the printed instructions contained therein must be strictly complied with. Fair wages clause. Each tender must be enclosed in the envelope provided, and delivered at the Education Offices (Room 119), Victoria Embankment, W.C., not later than 11 a.m. on June 26, after which hour no tender will be received.

June 26. Wakefield.—Erection of the second portion of the Main Institution of the Storries Hall Asylum, for the West Riding C.C. Plans may be seen, and bills of quantities obtained on application to the offices of the county architect until June 16. A deposit of £3 3s. is required. Cheques, &c., to be made payable to, and forwarded to the West Riding Treasurer, County Hall, Wakefield. Sealed tenders, properly endorsed, to be delivered at the offices of J. Vickers-Edwards, county architect, County Hall, Wakefield, not later than 9 a.m. on June 26.

June 26. Edgeworth.—Erection of a new public elementary school at Hob Lane, Edgeworth, near Bolton. The plans may be seen and bills of quantities obtained at the office of the county architect, Henry Littler, 16, Ribblesdale Place, Preston, by payment of a deposit of £2. Tenders must be delivered before noon on June 26, sealed and endorsed, to J. B. Goulburn, Turton U.D.C. Offices, Bromley Cross, near Bolton.

June 26. Leyton.—Pulling down of Knotts Green House, Leyton, E., and clearing the site, for the U.D.C. Specification, conditions and form of tender for the above may be obtained on written application on or before June 20 to William Jacques, A.R.I.B.A., of 2, Fen Court, Fenchurch Street, E.C. Sealed tenders (in special endorsed envelopes supplied with the forms) must be delivered at the meeting of the Council to be held on June 26 at 7 p.m.

June 27. Port Talbot.—Erection of thirty-five houses at Port Talbot. Plans and specifications may be seen at the offices of R. O. Clarke, C.E., Station Street, Port Talbot. Sealed tenders are to be addressed to Chairman of the Port Talbot Building Club, Grand Hotel, Port Talbot, not later than June 27.

June 28. Seaford.—Stabling, riding-school and house, for the Seaford West Co., Ltd., at Seaford. Names to be sent in at once to W. Lambe, Estate Office, Claremont Road, Seaford, Sussex, from whom quantities and other particulars can be obtained in due course on deposit of £3 3s., which will be returned on receipt of a bona-fide tender. All tenders to be sent sealed to the Estate Office by noon on June 28.

June 29. Shrewsbury.—Additions at Highley Council School. Plans and specifications may be seen, and bills of quantities and forms of tender obtained, at the offices of Gething & Son, architects, Oxford Chambers, Kidderminster, on payment of £1 1s. Tenders, sealed and endorsed "Highley Council School," should be delivered to H. E. Wale, secty., 11, College Hill, Shrewsbury, not later than noon on June 29.

June 30. Barmouth.—Erection of a new police-station at Barmouth. Plans, specifications and further particulars may be obtained from E. Vaughton, C.E.,

tounty surveyor, Arthog, Dolgelly. Sealed and endorsed tenders are to be sent to the Office of the Chief Constable, Dolgelly, on or before June 30.

No date. Menston.—Extension of the Sunday schools S. John's Church, Menston. Persons willing to tender are requested to send in their names to Milnes & France, architects, 99, Swan Arcade, Bradford, and bills of quantities will be forwarded to them when ready.

No date. Horbury Junction.—Erection of thirty-eight houses and shop at Horbury Junction, near Wakefield. For particulars apply to Garside & Pennington, architects and surveyors, Pontefract and Castleford.

No date. Inverness.—Mason, carpenter, plumber and painter and glazier works of proposed garage at the Palace Hotel, Inverness. Contractors desirous of tendering are requested to lodge their names with Cameron & Burnett, architects and ordained surveyors, Academy Buildings, from whom schedules of quantities and all other particulars are to be obtained.

No date. Longton.—Erection of new classrooms and other alterations and additions to Heathcote Road Wesleyan Mission, Longton. Builders desirous of tendering will please forward their names to William Wood, architect and surveyor, Longton.

No date. Preston.—Rebuilding of the vicarage, Woodplumpton, Preston. The Building Committee invite tenders for the above work. For particulars and bills of quantities apply to the architect, F. Mallott, Lambert Road, Ribblesdale, Preston.

No date. Grimsby.—Additions to the Fisherlads Institute, Orwell Street. Plans and specifications may be seen at the offices of the architect, J. J. Cresswell, 77, Victoria Street, Grimsby.

No date. Camborne.—Erection and completion of eight or nine four-roomed houses and enclosures at Dolcoath Road, Camborne, for J. T. Richards, East Hill, Tuckingmill. Plans and specifications may be seen (by appointment) on applying to above.

No date. Mosterton.—Building a cottage at Wes Farm, Mosterton, for Joseph S. Hull. For particulars apply to F. T. Maltby, A.M.I.C.E., architect and surveyor, Dorchester.

ENGINEERING.

June 14. Porth.—Erection of a retort-house and an installation of three tubular regenerators and settings at the Porth Gasworks, for the Rhondda U.D.C. The drawings and specifications may be seen and forms of tender supplied upon application to Octavius Thomas, engineer and manager, Gas and Water Offices, Pentre, Glam., upon depositing the sum of £2 2s. Fair wages clause. Tenders to be addressed to the Chairman of the Gas and Water Committee, endorsed "Contract No. 36," and delivered at the office of Walter P. Nicholas, clerk, Council Offices, Pentre, Glam., on or before 10 a.m. on June 14.

June 14. Ware.—Supply of a drying closet, with heating-stove and six drying horses; one hand-power 40-50 shirt-washing machine; and one 26in. hydro-extractor. Full particulars can be obtained on application to the Master, Ware Union Workhouse, Ware. Sealed tenders, marked "Tender for Laundry," to reach G. H. Gisby, clerk to the Guardians, Town Hall, Ware, on or before June 14.

June 15. Manchester.—Goods hoist with direct hydraulic ram, to lift 30 cwt. at the Gas Meter Depot, Whitworth Street West. Drawing may be seen and specification obtained at the office of the City Architect, Town Hall. Sealed tenders enclosed in the official envelope, to be delivered at the above office not later than 9 a.m. on June 15.

June 15. Southampton.—Reconstructing part of the Town Quay (contract No. 2). Drawings, specification and conditions may be seen on application to E. Cooper-Poole, A.M.I.C.E., engineer to the Board, Town Quay, Southampton, between 10 a.m. and 1 p.m. Bills of quantities and form of tender may be obtained upon payment of a deposit of £5. Tenders (which must be on the printed form supplied), sealed and endorsed "Tender for the Reconstruction of Town Quay (contract No. 2)," and accompanied by the priced bills of quantities in separate sealed packet, must be delivered to J. E. Pailthorpe, clerk to the Harbour Board, Town Quay, Southampton, not later than noon on June 15.

June 16. Tunstall.—Overhauling the heating apparatus at the Victoria Institute (including free library and museum), and keeping the same in repair for one year from the 1st August next. The apparatus can be inspected on application to the caretaker. Tenders, properly endorsed, to be sent to Arthur P. Llewellyn, secty., Education Committee, Tunstall, on or before June 16.

June 18. Pontypridd.—Extension of generating station, station engine-house, foundations for new sets, and all contingent works, for the U.D.C. Plans may be seen and specification and form of tender obtained on application at the office of the engineer and surveyor, P. R. A. Willoughby, A.M.I.C.E., upon receipt by the Clerk of a deposit of £1 1s. Tenders, on the prescribed forms, sealed and endorsed "Engine-house Extension," must be received by Colenso Jones, clerk to the Council, District Council Offices, Pontypridd, on or before June 18.

June 18. Stoke-upon-Trent.—Supply and delivery of various piping. Specification and form of tender may be obtained from the Electricity Works, Stoke-upon-Trent, on payment of a deposit of £2 2s. Tenders to be sent in, addressed "The Electricity Committee, Stoke-upon-Trent," not later than June 18, endorsed "Tender for Piping."

June 19. Ashford.—Reconstruction of Willesborough Bridge. Firms desirous of tendering can see the plan and specification and obtain bills of quantities and tender forms between 10 a.m. and 5 p.m. on deposit of £2. Sealed tenders, endorsed "Willesborough Bridge," are to be delivered to Frederick W. Ruck, county architect, Maidstone, signed, not later than 5 p.m. on June 19. Tenders not on the form provided will not be considered.

June 20. Middleton.—Extensions and improvements to the existing water-supply of the urban district, including the construction of a town reservoir. The plans and specifications can be seen during office hours at the Town Clerk's Office. The contractor will be required to accompany his tender with the names of two sureties, who will enter into a bond for £700 for the due, complete and satisfactory performance of his contract. Tenders will be received by Jerome J. Ronayne, town clerk, Middleton, not later than 11 a.m. on June 20.

June 25. Stonehouse.—Supply of a cooking range for the Stonehouse Workhouse, for about 120 inmates, including two steam jacketed boiling pans, large single steaming chamber, and one vertical steam boiler, the latter to heat coil in tanks for baths. Sealed tenders, with plans and specifications duly endorsed, to reach R. Robinson Rodd, clerk to the Guardians, 52, Union Street, East Stonehouse, Devon, not later than noon on June 25.

June 25. Dundalk.—Extension of waterworks, for the U.D.C. Providing and laying of about 2½ miles of 10in. diameter cast-iron water main, together with the providing and laying of hatch boxes on the new and existing mains, the building of a meter chamber and hatch box chambers, with drainage therefrom, and all other works shown or described on the plans, sections and specification prepared by Maurice Sellars, C.E., town surveyor, which can be seen at his office, Town Hall, Dundalk, during office hours, and from whom forms of tender can be obtained on the deposit of £3. Sealed tenders, endorsed "Extension of Waterworks," giving the names and addresses of two solvent sureties willing to join in a bond of £500 for the due performance of the contract (the cost of such bond must be paid by the contractor), to be lodged at the office of Mathew Camerford, town clerk, Town Hall, Dundalk, not later than noon on June 25, after which no tender will be received or considered.

June 25. Epsom.—Construction of an engine-house, suction gas-house, valve-chamber engine and pump foundations, and various other necessary works, for the U.D.C., at the Waterworks, East Street, Epsom. The work to be carried out to the specification and to the satisfaction of W. Vaux Graham, M.I.C.E., 5, Queen Anne's Gate, Westminster, where drawings may be seen and copies of the specification and bills of quantities obtained on payment of £5 5s. Sealed tenders upon the form provided, endorsed "Tender for New Engine-house, &c.," must be forwarded to E. G. Wilson, clerk to the Council, Church Street, Epsom, not later than the first post on June 25.

June 26. Mynyddislwyn.—Works of construction as follows:—No. 1: The construction of a bridge and culvert, together with embankment, ballasting, metalling and fencing, &c., at the boundary of the districts near Wattsville, for the Mynyddislwyn and Risca U.D.C. No. 2: The construction of a road 36ft. wide from a point near Wattsville to Messrs. Burney, Brown & Co.'s Colliery, for the Mynyddislwyn U.C. Plans and specifications may be seen and bills of quantities and forms of tender obtained from Harold Seymour, engineer, at his offices at Pontillanfraith, between 10 and 4, or by appointment and on the deposit of the sum of £2 2s. Tenders must include both of the above works, but separate prices must be given for each. The person or persons whose tender is accepted will be required to enter into a contract to be prepared on behalf of the Councils, together with bond with approved sureties for £500 in respect of each of the said works. Fair wages clause. Tenders, marked "Tenders for Bridge and Road," must be sealed and delivered to T. S. Edwards, 24, Stow Hill, Newport, Mon., on or before June 26.

June 26. London, W.C.—Construction of covered reservoirs and other works at Fortis Green, Hornsey, for the Metropolitan Water Board. Forms of tender and contract, with specification and bills of quantities, may be obtained and the drawings inspected on application to the Engineer at The Firs, Southern Road, Fortis Green, East Finchley, N., on production of an official receipt for the sum of £5, which sum must first be deposited with the Comptroller at the Board's Central Offices, at Savoy Court, Strand, W.C. Such payments and applications must be made between the hours of 10 and 4 (except on Saturdays). Tenders, enclosed in sealed envelopes, addressed to "The Clerk of the Board," Metropolitan Water Board, Savoy Court, Strand, W.C., and endorsed "Tender for Reservoirs, Fortis Green," must be delivered at the Offices of the Board not later than 10 a.m. on June 26.

June 27. London, W.—Two triple-expansion steam pumping engines for the Hammersmith Pumping Station of the Western District, for the Metropolitan Water Board. Forms of tender and contract, with specification, may be obtained on application to the District Engineer, Standish Road, Hammersmith, W., on production of an official receipt for the sum of £5, which sum must first be deposited with the Comptroller at the Board's Central Offices, Savoy Court, Strand, W.C. Such payments and applications must be made between the hours of 10 and 4 (except on Saturdays). Tenders, enclosed in sealed envelopes, addressed to the Clerk of the Board, Metropolitan Water Board, Savoy Court, Strand, W.C., and endorsed "Tender for Pumping Engines, Western District," must be delivered at the Offices of the Board not later than 10 a.m. on June 27.

June 28. Beverley.—Supply and delivery of a Cornish boiler, 20ft. long by 5ft. 6ins. in diameter, at the Gasworks. The drawings may be seen and copies of the specification and full particulars obtained on application to F. W. Oldfield, engineer, Gas Offices, Hull Road, Beverley. Sealed tenders, endorsed "Tender for Boiler," must be delivered at the Town Clerk's Office not later than 10 a.m. on June 28.

July 1. Groningen (Holland).—Construction of a gasholder (including foundation) of a diameter of about 42 metres and a capacity of about 30,000 cubic metres. Drawings, &c., price 2/50 fl. (gs. 2d.), obtainable from Directeur van het Gasbedrijf, Groningen. Tenders to be sent in by July 1.

July 14. Madrid.—Erection of a cement or "biton" bridge over the Ebro River at Saragossa. For particulars apply to Direccion General de Obras Publicas, Madrid. Tenders to be sent in by July 14.

Wooden Sun Blinds.

Our attention has been called to the Baumann blind, the use of which has rapidly spread in Switzerland, France and Italy. It has been recently introduced in this country, as a matter of fact at the request of persons who had seen it abroad. The construction of this blind or shutter has been extended to roller shutters, screens, roller fronts to wardrobes, desks, cupboards, &c. Its appearance is superior to the linen blind, and it is far more serviceable, being perfectly rigid when down, yet so flexible that it rolls up into a very small space. Its durability, too, is proved by the fact that these blinds have been in use for over ten years and are still in good working order. The maker, Mr. W. Baumann, whose London address is at 69, Finsbury Pavement E.C., states that the blind costs little more in first cost than linen blinds. The construction of the blind is shown by the illustrations herewith. It will be seen that the Baumann blind is made of wooden laths cut obliquely and fastened to galvanized steel bands. The sides of the blind run in slots, which give rigidity when the blind is down. The laths vary from ½ in. in thickness, and are either placed close together or at intervals, as shown in Fig. 1, when the penetration of light and air is desired. The blinds are easily handled and, being well balanced, will remain at any height they are placed at. The bottom can be thrown forward by a projecting apparatus, as shown in Fig. 2. As a blind over 6ft. in

FIG. 1.—ACTUAL SIZE OF BAUMANN BLIND.

length can be rolled into a space of about 6ins. by 6ins., it can be fixed without difficulty between the reveals of most existing windows. It can, however, if required be fixed outside the window. In new buildings it would obviously be preferable to fix the roller behind a groove so as neither to obstruct the light nor be visible when rolled up.

An Innovation in Ironmongery Catalogues.

It is a constant source of annoyance that the ordinary catalogues of such goods as ironmongery and builders' hardware do not contain sufficient data regarding the sizes of the articles illustrated to be of real service in the preparation of working drawings and in the manufacture of parts of construction. Without exact sizes these cannot be completely finished where there are opportunities for economy of labour and time. It becomes necessary to fit goods on the job. One of the items on which a good deal of time is always wasted is in the fitting of locks to doors after manufacture, and perhaps fixing. In repair works the same applies also. The reason is that it is difficult to ascertain the exact size of locks, and so these goods are purchased haphazard and the woodwork cut about for them. Indeed, if mortices have been left, they generally have either to be enlarged to take the locks or the spaces are too large to begin with. We are glad therefore to see that Messrs. Carter & Aynsley, Ltd., of 54, Bishopsgate Street, E.C., are endeavouring to overcome this fruitful cause of delay and annoyance by publishing a catalogue which contains complete information about the sizes of locks. Their catalogue contains full-size photographic reproductions of a large number and wide variety of locks, together with keys and other details. It is therefore easy to obtain the exact dimensions of any lock, thus enabling the door to be prepared in the workshop to receive the lock exactly, while in the case of substituting new locks in place of old ones on existing doors this catalogue makes it possible to order a lock to fit the particular position, thus saving in the cost of repairs.

FIG. 2. BAUMANN BLIND CONCEALED IN GROOVE.

Tenders.

Addressed postcards on which lists of tenders may be stated will be sent post free on application to the Manager, BUILDERS' JOURNAL, Great New Street, Fetter Lane, E.C.

Information from accredited sources should be sent to 'The Editor' at latest by noon on Monday if intended for publication in the following Wednesday's issue. Results of Tenders cannot be accepted unless they contain the name of the Architect or Surveyor for the work.

Aberdeen.—For various works at Garthdee, Aberdeen, for Richards, Ltd. Messrs. Wilsons & Walker, architects, 18A, Union Street, Aberdeen. Quantities by architects:—

CONTRACT LIST (continued from p. 323).

No date. Wigton.—Providing and laying about 3,760 lineal yds. of 6in. diameter cast-iron piping with valves, &c., complete according to plans, sections and specification prepared for the U.D.C. by the engineer, Joseph Graham, Bank Chambers, Bank Street, Carlisle. Plans and specification may be seen at the engineer's office and bill of quantities obtained on payment of £1 1s.

IRON AND STEEL.

June 14. Bude.—1,800 lineal yds. of 3in. cast-iron spigot and socket water-pipes of the following description:—Length of pipe 9ft., depth of socket 3ins., thickness of joint 1in. or 1½in., weight of each pipe 120 lb., for the U.D.C. All pipes to be coated with Dr. Angus Smith's solution whilst hot, both inside and out. All pipes to be tested at the works with a feet head of water of 600. Tenders to be marked "Water-pipes," and sent to R. A. Foster Melliar, clerk to the Council, Council Offices, Bude, not later than June 14.

June 19. Skipton.—Supply and delivery free of about 470 lineal yds. of unclimbable wrought-iron hurdles, 6ft. in height, with the necessary gates, &c., for the U.D.C. Specification and further particulars may be obtained (on payment of 10s. 6d.) on application to John Mallinson, surveyor to the Council, Town Hall Skipton, and sealed tenders, endorsed "Hurdles," are to be sent to him not later than June 19.

June 20. Cherbourg.—Supply of ironmongery to the marine services to the estimated value of 12,682 francs. A deposit of 634 francs is required. For particulars apply, Administration of Marine, Cherbourg. Tenders to be sent in by June 20.

PAINTING AND PLUMBING.

June 15. Bournemouth.—Painting at the Sanitary Hospital. Full particulars, forms of tender and specification can be obtained of the borough engineer, F. W. Lacey, at whose office drawings can be seen, provided that the sum of £1 1s. has been previously deposited in respect of the tender. Tenders to be sent in, in envelopes furnished for the purpose, to the town clerk, George William Bailey, before noon on June 15.

June 15. Wallsend.—Cleaning and painting of the Bunde and Carville Council Schools. Particulars and forms of specification may be had on application to George Hollings, borough surveyor, Corporation Offices, Wallsend. Sealed tenders, endorsed "Tenders for Cleaning and Painting Bunde and Carville Schools," to be received by W. V. Mulcaster, town clerk of Wallsend, 28, Sandhill, Newcastle-upon-Tyne, on or before June 15.

June 15. Canterbury.—Works of plastering, repairs, painting, and other works in connection therewith to Br Block, Male, of the Kent County Asylum, Chatham Downs, near Canterbury. The plans and specifications can be seen at the office of W. J. Jennings, architect, and copies of the bills of quantities obtained therefrom, on depositing the sum of £5 5s. Tenders to be delivered to the Asylum, addressed to the Chairman of the Committee of Visitors, not later than 10 a.m. on June 15.

June 16. Bridlington.—Painting the various buildings at the Sanatorium, in accordance with specification, which may be seen at any time during office hours at the office of the Borough Surveyor, Town Hall, Bridlington. The date of completion for this work will be July 30. Tenders, endorsed "Sanatorium Painting," to be sent to A. E. Matthewman, town clerk, Town Hall, Bridlington, not later than June 16.

June 18. Bristol.—Painting, colouring, &c., of certain schools, for the Education Committee. Specifications and conditions of contract may be obtained from Peter Addie at the City Valuer's Office, Council House, on payment of £1 1s. Each tender must be sent in a separate envelope, endorsed with the name of the school to which it refers, and must reach William Avery Adams, secy., Guildhall, Bristol, not later than noon on June 18.

June 18. Portsmouth.—Painting and cleaning certain schools, in accordance with a specification prepared by the Surveyor. Form of tender and all information may be obtained from the surveyor, A. H. Bone, at his offices, Cambridge Junction, Portsmouth. Fair wages clause. Tenders should be delivered at the Committee's Office, Town Hall, Portsmouth, not later than 10 a.m. on June 18.

June 19. London, W.—Painting and other works at the infirmary in the Harrow Road, for the Paddington Guardians. A copy of the specification and form of tender may be obtained at the offices of the architect, E. Howley Sim, Mowbray House, 14, Norfolk Street, Strand, W.C., on payment of a deposit of £1 (by cheque). Fair wages clause. Sealed tenders, endorsed "Tender for Painting the Infirmary," must be delivered at the offices of the Guardians, 313-319, Harrow Road, W., before 5 p.m. on June 19.

June 19. London.—Cleaning, re-painting, re-gilding, &c., of (1) Battersea Bridge, (2) Hammersmith Bridge, (3) Westminster Bridge, for the London County Council. Persons desiring to submit tenders for the work respecting any or all of these bridges may obtain the specifications, bills of quantities, forms of tender and other particulars on application to the chief engineer, Maurice Fitzmaurice, C.M.G., at the County Hall, Spring Gardens, S.W., upon payment to the cashier of the Council of the sum of £1 in respect of the particulars for each bridge. Full particulars may be obtained on application at the County Hall previously to the payment of the fee for the specification, &c. Tenders must be upon the official forms, and the printed instructions contained therein must be strictly complied with. Fair wages clause. Each tender is to be delivered at the County Hall in a sealed cover, addressed to the Clerk of the London County Council, Spring Gardens, S.W., and marked "Tender for Painting, &c., Battersea Bridge," "Tender for Painting, &c., Hammersmith Bridge," or "Tender for Painting, &c., Westminster Bridge," as the case may be. No tender will be received after 10 a.m. on June 19.

June 20. Belfast.—Painting at Belfast Cemetery. Specification may be seen in the City Surveyor's Office. Sealed tenders, endorsed "Painting at Cemetery," to be lodged in the Town Clerk's Office before 11 a.m. on June 20.

June 22. West Hartlepool.—Painting, &c., inside and outside of premises, Hart Road, West Hartlepool, as per specification to be obtained at the Guardians' Office. Tenders to be endorsed "Painting," and delivered to George Kilvington, Union clerk, Hart Road, West Hartlepool, not later than noon on June 22.

June 23. Edinburgh.—Painterwork at various schools. Specifications can be obtained at Mr. Carfrae's office, 3, Queen Street. Estimates, duly marked on outside, must be lodged with the Clerk of the Board on or before June 23.

June 26. Leyton.—Cleansing, painting, repairs and alterations to schools, to be executed during the summer vacation. Specifications, conditions and form of tender for the above may be obtained on written application on or before Monday, June 18th, 1906, to William Jacques, A.R.I.B.A., of 2, Fen Court, Fenchurch Street, E.C., which application must be accompanied by a deposit of £1 (cheques will not be accepted). Sealed tenders (in special endorsed envelopes supplied with the forms) must be delivered at the meeting of the Council to be held on June 26, at 7 p.m. Fair wages clause.

June 28. Ruthin.—Painting and repairs necessary to each of the following Council schools, within the Ruabon Grouped Schools District:—(1) Acrefair Council School, (2) Rhoslanerchrugog Infants' School. Specifications and particulars of the above works can be inspected at the offices of Walter D. Willes, county architect and surveyor, 42A, High Street, Wrexham, or at the respective schools on application. Sealed tenders are to be delivered to Evans & Roberts, secuties, Education Offices, Ruthin, on or before June 28, endorsed on the outside with the name of the school at which the work is tendered for.

ROADS AND CARTAGE.

June 14. Cowpen.—Making-up Newsham Road, Back Harper Street and other back streets (representing a total area of about 3,700 sq. yds.), for the U.D.C. Plans, sections and specifications may be seen and forms of tender obtained at the offices of the Surveyor, Seaforth Street, Waterloo, Blyth. Sealed tenders, endorsed "Tender for Street Work," must be delivered not later than 4 p.m. on June 14.

June 15. Kirkcaldy.—Laying granolithic throughout the burgh. Copies of the quantities and specification obtained upon application at Burgh Surveyor's Office. Tenders to be left with W. L. Macindoe, town clerk, Town Clerk's Office, Kirkcaldy, not later than June 15.

June 15. Dundee. Supply and delivery of 510 tons of whinstone causeway sets, 5in. by 7in. Offerors to state the name of the quarry from which the sets they propose to supply are taken, and price must include for delivery at any part of Dundee Harbour as may be pointed out. Sealed offers, marked "Tender for Causeway Blocks," to be lodged with John Thompson, M.I.C.E., harbour engineer, Harbour Engineer's Office, Dundee, not later than 10 a.m. on June 15.

June 16. Devonport.—Levelling, paving and completing (under section 150 of the Public Health Act, 1875) the following lanes:—Contract 94: Lane between Tamaz and Warleigh Avenues; contract 97: Lane rear of Nos. 40 to 56, Wilton Street (part of). Plans, specification and conditions may be seen and forms of tender and bills of quantities obtained at the Surveyor's office, Municipal Offices, 29, Ker Street, Devonport, on payment of £1 1s. for each set of quantities. Separate sealed tenders, addressed to John F. Burns, borough surveyor, Municipal Offices, before noon on June 16.

June 18. Plymouth.—Making-up and completing, under section 150 of the Public Health Act, 1875, the following streets and lanes:—Beckham Place; Bute Road; Pier Street Ope; Ivydale Road Lane West, No. 2; Ivydale Road Lane East, No. 2. Plans and specifications and conditions upon which forms of tender will be granted may be seen at the office of James Paton, borough engineer, Plymouth, and bills of quantities obtained. Sealed tenders must be delivered at the Municipal Offices, Plymouth, not later than 5 p.m. on June 18.

June 19. Walton-on-Thames.—Supply of 1,200 tons of 1½in. broken granite, delivered as required during the period ending March 31 next, for the U.D.C. Specification and form of tender may be obtained on application to R. Wilds, surveyor, Council Offices, Walton-on-Thames, to whom tenders, sealed and endorsed "Tender for Granite," must be delivered not later than mid-day on June 19.

June 19. Thornhill.—Supply of the following materials, for the U.D.C., for the year ending March 31, 1907:—Best hand-picked furnace slag; best hand and machine-broken furnace slag; slag chippings. To be delivered at such stations within the district of Thornhill, and in such quantities as the Council shall during the above period from time to time order. Forms of tender and specification may be obtained on application to A. Rothra, engineer and surveyor. Tenders, on the form supplied, and accompanied by a sample of each of the materials quoted for, must be delivered to the Clerk of the Council not later than 5 p.m. on June 19, 1906, marked "Tender for Slag."

June 20. Bournemouth.—Making-up Lowther Road, second portion. Full particulars, forms of tender, specification and schedule can be obtained of the borough engineer, F. W. Lacey, at whose office drawings can be seen provided that the sum of £1 1s. has been previously deposited in respect to the tender. Tenders to be sent in, in envelopes furnished for the purpose, to the Town Clerk (G. W. Bailey) before 11 a.m. on June 20.

June 20. Enfield.—Broken granite, for the U.D.C. Supply of 2,500 tons (more or less) of broken Cleve Hill dhu or best blue Guernsey granite, and 1,150 tons (more or less) of broken Leicestershire or other approved granite, to be delivered free in such quantities and at

such times prior to March 31, 1907, as may be ordered by the Council's Surveyor at the several railway stations in the district. Tenders (on forms to be obtained only of Richard Collins, the Council's surveyor at his office), endorsed "Tender for Granite," together with samples as to size and quality of the granite proposed to be supplied (no tender will be considered unless accompanied by samples), to be sent in to T. W. Scott, clerk to the Council, Public Offices, Enfield, not later than noon on June 20.

June 21. North Walsham.—350 tons of granite (broken to a 1½in. ring gauge) and 30 tons of granite chips, the whole thereof to be delivered free to either of the North Walsham Railway Stations in September or October next, for the U.D.C. Sealed tenders, endorsed "Tender for Granite," to be sent on contractor's own form, with samples, to E. J. Simpson, surveyor to the Council, North Walsham, on or before June 21.

June 22. Cleckheaton.—Supply of granite, dress, circular kerbs and sets, for the U.D.C. Forms of tender, conditions and full particulars may be had on application at the Town Hall. Sealed tenders, marked "Tender for —," addressed to John H. Linfield, clerk to the Council, Town Hall, Cleckheaton, to be delivered not later than 4 p.m. on June 22.

June 23. Nantwich.—Carting of road material and other team-work in connection with the maintenance and repair of the highways under its jurisdiction, for the year ending June 30, 1907, for the R.D.C. Contractors may tender for the whole or any of the parishes in the rural district. Forms of tender may be obtained on application at 152, Hospital Street, Nantwich, and all tenders must be made out strictly in accordance with the forms provided or they will be liable to be disqualified. Further information may be obtained from the Council's surveyors, J. R. Whittingham, Stapley, and T. J. Peake, Willaston. Tenders to be sent in, marked "Team Labour," to C. E. Speakman, clerk.

June 23. Bedwellty.—Supply and delivery of limestone broken to pass through a 2in. ring, also limestone screenings for the U.D.C., to be delivered, carriage paid, during the months of December, 1906, and January, 1907, at such rate as shall be required by the Surveyor, as follows, the quantities being more or less:—150 tons of limestone to Whiterose Station, B. & M. Railway; 50 tons of screenings, to Whiterose Station, B. & M. Railway; 150 tons of limestone, to Aberbargoed Station, B. & M. Railway; 250 tons of limestone, to Pengam Station, B. & M. Railway; 50 tons of screenings, to Pengam Station, B. & M. Railway; 350 tons of limestone, to Blackwood Station, L. & N.W. Railway; 50 tons of screenings, to Blackwood Station, L. & N.W. Railway; 100 tons of limestone, to Argoed Station, L. & N.W. Railway; 20 tons of screenings, to Argoed Station, L. & N.W. Railway. Sealed tenders, giving price per ton and endorsed "Tenders for Limestone," to be sent to T. J. Thomas, clerk, Bargoed, signed on or before June 23. Samples to be sent, carriage paid, addressed to J. H. Lewis A.M.I.C.E., Council Office, New Tredegar, via Cardiff. The contractor will have to enter into a contract and bond with two sureties for the due and faithful performance thereof, and pay the sum of £3, being the cost of preparing same, including stamp duties.

June 26. London, E.—Making-up the following streets for the West Ham Borough Council:—Group 1: Pretoria Road, Ladysmith Road, Mafeking Road. Group 2: Beekton Road, Brock Road, Chadwin Road, Chadwin Road East, Cranley Road, Denmark Street, Egham Road, Saloman's Road, Selby Road. Group 3: Durban Road, Springfield Road. Plans may be seen and specification, form of tender and further particulars obtained at the office of John G. Morley, borough engineer, Town Hall, West Ham, E., upon payment of £1. Tenders, endorsed "Tender for Private Street Works," to be sent to F. E. Hilleary, Town Hall, West Ham, E., not later than 4 p.m. on June 26. Fair wages clause.

June 26. Bromley.—Making-up the following road materials:—3 725 cub. yds. of broken stone, i.e., Guernsey granite, Leicestershire granite, Cherbourg quartzite, Penlee elvan or basalt, to be delivered free by rail at the Council's siding at the Bromley North Station (South Eastern and Chatham Railway); 250 cub. yds. of broken surface or pit flints, to be delivered free by rail at the Council's siding as above; 197 cub. yds. of broken surface or pit flints, to be delivered at Bickley Station; 625 cub. yds. of broken surface or pit flints, to be delivered on Barnet Wood Road, Brewery Road, Lower Gravel Road, Princes Plain and Jackson Road as required; 740 cub. yds. of broken surface or pit flints, to be delivered on Turpington Lane, Magpie Hall Lane and Southborough as required; 200 cub. yds. of broken surface or pit flints to be delivered in trucks, free of all charges, at Chislehurst Goods Station. Samples of each description tendered for must accompany the tender. Haulage by traction engine and trucks will not be permitted unless the vehicles are hung on proper springs. Tenders must be made on printed forms to be obtained at the office of the Borough Engineer, Municipal Offices, Bromley, and must be endorsed "Tender for Road Materials," and addressed to Frederick H. Norman, town clerk, Municipal Offices, Bromley, Kent, not later than 3 p.m. on June 26.

July 2. Bedford.—Supply of about 2,100 tons of broken granite for road-making, to be delivered at the Railway Station at Bedford, in such quantities as the Surveyor shall from time to time order during the year ending Sept. 3, 1907. Forms of tender and further particulars as to gauge, &c. can be obtained on application. Tenders, endorsed "Tender for Granite," to be sent to Hedley Baxter, town clerk, Town Hall, Bedford, on or before July 2.

July 2. Sunbury-on-Thames.—Supply and free delivery for the coming season of not less than 400 tons of Bardon Hill (Leicestershire) granite, broken to pass through a 1½in. ring, for the U.D.C.; also for the supply and delivery of not less than 500 cub. yds. of Kentish brown pit flints, delivered at Clark's Riverside Wharf, Sunbury-on-Thames. Further particulars may be obtained of Harold F. Coales, surveyor to the Council. Sealed tenders, endorsed "Granite" and "Flints" respectively, to be delivered to Charles E. Goddard, clerk, Council Offices, Sunbury-on-Thames, before 4 p.m. on July 2.

No date. Letchworth.—Roads. Firms wishing to tender for the construction of further group of roads are invited to apply, enclosing £1 rs. for specification and bill of quantities. Plans may be inspected at the Estate Office, Letchworth.

SANITARY.

June 14. Warminster.—Under-draining the sewage farm at the Marsh, Warminster, which consists of an area of about 20 acres, for the U.D.C. Plans and specifications can be seen and further particulars obtained at the Surveyor's Office, High Street, Warminster, and sealed tender, endorsed "Under-draining," must be delivered to Herbert J. Wakeman, clerk to the Council, Council Offices, Warminster, not later than noon on June 14.

June 14. Ashbourne.—Laying a length of sewer and laying and making a septic tank and filter bed and other works for the disposal of the sewage at Hartington Town Quarter. Specifications may be had on application to J. H. Wheelodon, Poor Law Offices, Compton Street, Ashbourne, and plans may be seen at such office on previous appointment. Tenders must be sent in to W. R. Holland, under cover, addressed "The Clerk, R.D.C., Ashbourne," and marked "Hartington Sewage," not later than 10 a.m. on June 14.

June 14. Aberdeen.—Constructing an outfall sewer from the Aberdeen Poorhouse, to join the existing city sewerage system in Queen's Road, near Hollybank. Plans may be seen in the office of Jenkins & Marr, 16, Bridge Street, who will supply schedules of quantities to intending offerors. Sealed tenders, endorsed "Sewer," to be lodged in proper form with C. B. Williams, inspector of poor, 20, Union Terrace, Aberdeen, on or before 4 p.m. on June 14.

June 15. Kirkcaldy.—Construction of sewers at Dunnikier and Overton Roads. The plans may be seen and quantities and specifications of the works obtained upon application at the Burgh Surveyor's Office. Tenders to be left with W. L. Macindoe, town clerk, Town Clerk's Office, Kirkcaldy, not later than June 15.

June 15. Nottingham.—Erection of a urinal, Pennyfoot Street. Plans may be seen and copies of the bill of quantities and form of tender obtained from Frank B. Lewis, city architect, Guildhall, on payment of a deposit of £1 rs. Sealed tenders, addressed to Samuel G. Johnson, town clerk, and endorsed "Tender for Urinal, Pennyfoot Street," to be delivered at his office, the Guildhall, before 10 a.m. on June 15. Fair wages clause. The lowest or any tender will not necessarily be accepted, and tenders will only be accepted from persons who conform to the conditions of contract as regards paying the local standard rate of wages and complying with the working rules of the Nottingham district.

June 18. London, N.—Construction of sewage filter beds and stormwater beds, open septic and other tanks, together with channels, culverts, pipes, valves and other

works, for the Finchley U.D.C. Drawings may be seen and copies of bills of quantities, specification, and form of tender obtained on application to the Offices of the Engineer and Surveyor, Church End, Finchley, N., on payment of £3 3s. Sealed tenders, endorsed "Sewage Purification Works," and addressed to E. H. Lister, clerk, Council Offices, Church End, Finchley, N., to be sent in by not later than noon on June 18.

June 22. Levenshulme.—Sewering, draining, paving, curbing, flagging, channelling and completing the following streets and passages in the district of the U.D.C. Carril Grove East extension, Mount Street extension, Derby Street extension, Lonsdale Road, Hawthorn Road, passages rear of Clifford Street, Church View, &c., passage rear of Roston and Mercer Streets, passage rear of Roston and Wetherall Streets, passages rear of Lonsdale and Hawthorn Roads, passage rear of 1 to 13, Cromwell Grove, and 17 to 61, Cromwell Grove. Specifications, bills of quantities, and further particulars may be obtained from the Council's surveyor, James Jephson, Guardian Chambers, Tiviot Dale, Stockport, on payment of £2 2s. Tenders, endorsed "Tender for Private Street Works," to be sealed and delivered to J. Ogden Hardicker, clerk to the Council, Northern Assurance Buildings, Albert Square, Manchester, on or before June 22.

June 25. London, S.W.—Construction of underground sanitary conveniences at Station Road, Balham. The specification, drawings, form of contract, and other particulars may be seen and form of tender and copy of bills of quantities obtained at the Surveyor's Office, No. 215, Balham High Road, S.W., between 10 and 4 (Saturdays 10 to 1), on payment of £1 rs. Fair wages clause. Tenders, sealed, and endorsed "Tender for Conveniences," are to be delivered at the Council House, Wandsworth, S.W., not later than June 25.

TIMBER.

June 18. Manchester.—Supply and delivery of timber during twelve months ending June 30, 1907. Particulars and forms of tender on application from Charles Nickson, superintendent, Gas Department, Town Hall, Manchester. Tenders to the Chairman of the Gas Committee, at the Town Hall, by 9 a.m. on June 18.

MISCELLANEOUS.

June 14. London, E.C.—Supply of the following stores, for the Great Indian Peninsula Railway:—Passenger engines and tenders; pig-iron; plate and sheet glass, &c., lorry wheels, axles, &c.; copper plates and rods; galvanized corrugated sheets; locks. Specifications and forms of tender may be obtained at the office on payment of the fee for the specification, which payment will not be returned. Tenders must be delivered in sealed envelopes, addressed to J. I. Berry, secy., Company's Offices, 48, Copthall Avenue, London, E.C., marked "Tender for Passenger Engines and Tenders," or, as the case may be, not later than 11 a.m. on June 14.

June 18. London, E.C.—Supply of the following stores, for the Powell Duffryn Steam Coal Co., Ltd.:—Bar and other iron; bolts, nuts, rivets, &c.; brass fittings; colliers' tools, &c.; ironmongery; girders, channels and rails; nails; steel; steam tubes and fittings; chains; timber, deals, &c.; French pitwood; Swedish pitwood; cement and lime; electrical fittings. Forms of tender and all particulars can be obtained on application to the Stores Manager, Aberaman Offices, near Aberdare. Tenders to be addressed to the directors of the Powell Duffryn Steam Coal Co., Ltd., 101, Leadenhall Street, London, E.C., and posted so as to be received not later than 10 a.m. on June 18.

June 18. Portsmouth.—Supplies to the various schools of sundries required for cleaning and petty repairs. Samples may be seen and form of tender obtained at the Education Committee's Offices. Tenders should be delivered at the Committee's Offices, Town Hall, Portsmouth, at or before 10 a.m. on June 18.

June 18. Chelmsford.—Supplying and fixing at their new reservoir at Long Stumps, 70 yds. of oak fencing 6ft. high, and for 200 yds. of unclimbable wrought iron fencing 4ft. 6ins. high, the specification for which can be seen at the office of the borough surveyor, Cuthbert Brown, 16, London Road, Chelmsford. Tenders, sealed and endorsed outside "Fencing for Reservoir," to be sent to Thomas Dixon, town clerk, 16, London Road, Chelmsford, not later than noon on June 18.

June 19. London.—Supply of following stores for the Secretary of State for India in Council:—150ft. deck spans, bearing plates, spikes. The conditions of contract may be obtained on application to the Director General of Stores, India Office, Whitehall, S.W., and tenders are to be delivered at that office by 2 p.m. on June 19.

June 21. Dudley.—Covering about 700 yds. of pipes at the Workhouse, with good non-conducting material, in accordance with specification to be obtained from the Workhouse master. Sealed tenders, together with sample of covering, to be sent so as to reach Gaius W. Coster, clerk to the Guardians, Union Offices, St. James' Road, Dudley, not later than 10 a.m. on June 21.

June 23. Aarhus (Denmark).—Supply of about 60 tons of bolts and 16,500 tons of cement, to be delivered in accordance with conditions, drawings, &c., which may be obtained on application at the Harbour Engineer's Office ("Havneingeniørens Kontor"), at which office tenders will be received up to 3 p.m. on June 23. A copy of the conditions (in Danish) and drawings may be seen at the Commercial Intelligence Branch of the Board of Trade, 73, Basinghall Street, E.C.

June 26. London, S.W.—Supply of the following stores for the Southern Mahratta Railway Co., Ltd.:—8,800 safety chains, 9,736 spiral and volute springs, 20 tons copper ingots, as per specifications and drawings, which may be seen at the offices of the Company. The charge for each specification is £1 rs. which will not be returned. Tenders must be marked "Tender for Safety Chains," or, as the case may be, addressed to Edward Z. Thornton, secy., 46, Queen Anne's Gate, S.W., not later than June 26.

A COMPLETE SCHEME OF DECORATION.

This illustration shows a complete scheme of decoration carried out with Hall's Distemper. This Distemper overcomes the difficulty of obtaining a uniform tint on plain walls, and is the most easily manipulated material for stencilling friezes, dadoes, panels, etc., where the softness and delicacy of its tints are seen to great advantage.

Stencils for artistic friezes suitable for halls, drawing, dining, billiard rooms, etc., are now obtainable from the manufacturers. Decorators will find these designs, which are specially prepared for Hall's Distemper, a great aid to artistic effect.

Full particulars can be obtained from SISSONS BROTHERS & Co., Ltd., HULL. London Office: 199^a, Boro' High Street, S.E.

THE BUILDERS' JOURNAL AND ARCHITECTURAL ENGINEER.

June 13th, 1906.

SPECIAL SUPPLEMENT:—

A Striking Example of Rapid Re-building after Fire.

RECONSTRUCTION OF A FACTORY BUILDING AT KILBOWIE, NEAR GLASGOW.

ON Thursday, March 1st, 1906, about 5 o'clock in the morning, a fire broke out in the japanning shops of the Singer Manufacturing Co., Ltd., at Kilbowie, near Glasgow. It took seven hours to extinguish it completely. About noon on Thursday a man was running from Dalmuir, an adjoining suburb. A friendly hail from a passer-by warned him that the fire was out and hurry was wasted. "I'll no' walk," gasped the runner, "for if I do McAlpine's will have rebuilt the place before I get there," which goes to show that American humour is getting grafted on to the pawky Scotch variety, and that Messrs. Robert McAlpine & Sons have a wholesale reputation in the locality for speedy work.

The prolonged wail of the siren which indicates the discovery of fire, and the black and twisted *débris* of a few hours later, were serious shocks to the workers at this great factory and to the management.

The destruction of one great department in a works so delicately organized meant complete disorganization. In such case the period of distress likely to prevail would only be limited by the speed with which the building could be reconstructed.

From the point of view of the management of the company such a position was no less serious. The pecuniary loss involved by

the reduction of output can well be imagined when it is remembered that the factory, when working at full strength, turns out the almost incredible number of 22,000 sewing machines per week.

In all, over 10,000 workers are employed in the factory, and the fire threw over 500 out of employment, but fortunately only for three days, as temporary provision was made for the workers in a building which had just been completed and not yet occupied.

The building destroyed by fire was two storeys, of about 30ft. in height, 275ft. long by 103ft. broad. It was roofed with timber trusses in three spans, covered with matchboarding and slates. The couples were supported by the outer walls and by two rows of twenty-six cast-iron columns. The windows were of wood glazed with sheet-glass, and the walls of 18in. brickwork with 4½in. buttresses. The ground floor was formed of concrete covered with cast-iron plates, and the first floor of rolled-steel joists at 3ft. 6in. centres, with 4½in. brick-arching between, haunched with concrete and covered with two layers of flooring nailed to timber joists embedded in the concrete.

The internal furnishings of the ground floor consisted of japanning drying stoves, dipping apparatus, dripping and other benches, which were undamaged by the fire but suffered from water. The first floor was equipped with a series of varnish and transfer stoves, made of timber lined with tin, and all manner of timber benches and

stools. There were also offices screened from the rest of the building by glazed wooden frames, and a network of tin flue-pipes transmitted the heated gases from the stoves to the outside air. The contents of the building included large quantities of oil, varnish and inflammable material used in the process of finishing.

The destruction of stock was considerable. There were about 51,000 sewing machines in the building, and most of them were totally destroyed. An impression of the extent of the fire may be made by referring to the photographs of Figs. 1 and 2, taken on the day of the fire (March 1st) as soon as the flames were extinguished.

With the arrival on the site of the manager of Messrs. Singer a consultation was held with the representative of Messrs. Robert McAlpine & Sons, who were immediately entrusted with the reconstruction. The first thing to be done was to have the *débris* and damaged machines removed and the injured brickwork pulled down. Men were started to work as soon as the materials were cool enough to be handled, and when there was no danger of fire breaking out again. By the afternoon over 100 men were employed, and the following day (Friday, March 2nd) room was found for fifty more. On Saturday 250 men were engaged on the work. By Monday the number was increased to 500, and work was carried on day and night.

As already stated, temporary arrangements were made in another building to carry on

FIG. 1.—THURSDAY, MARCH 1ST, 1906; NOON.

the work of the department thrown idle on the first floor. The ground floor being practically intact and only requiring the alteration of some flue-pipes, it was decided to cover the first floor with a temporary roof to prevent rain and the water from concrete and brickwork from falling on the stoves and machines on the ground floor, and so enable work to be carried on. It was also decided to do away with the cast-iron columns of the first floor and to add another storey to the height of the building. Plans for an entirely fire-resisting building were at once proceeded with. The design adopted for the temporary roofing of the first floor was what is generally known as the "Belfast" truss, as the timber could most readily be got from stock. The construction was so speedily performed that a friend from the States unwittingly inquired for information regarding the "Builtfast" roof. The breadth of the building, 100 feet, was divided into three spans, and the bearers and supports of the

lineal feet, or nearly four miles, of 6in. by 1½in. boards, and 60,000 lineal feet, or nearly twelve miles, of 3in. by 1½in. timber, while 3,400 sq. yds. of matchboarding and 3,500 sq. yds. of felt (or nearly three-quarters of an acre of each) were also used. The first load of timber arrived about 5.30 p.m. on Friday, March 2nd, and the roof was entirely finished by Tuesday, March 5th—smart work for four days.

While the temporary timber roof was being constructed the erection of three three-tower gantries about 35ft. high for steam cranes was pushed forward, and a temporary railway laid along the east side of the work in order to deal with the raising of the materials. Arrangements were also made for the erection of two subsidiary cranes for the erection of the steelwork. The contractors' crushers were kept going day and night for the crushing of the steel slag of which the concrete (termed "ferrolithic" by Messrs. McAlpine) is composed. It is very satisfactory to record that

the temporary centering for the floor erected, and the casing of "ferrolithic" concrete to the floor laid. The shuttering is well seen on photos Nos. 3 and 5. This work was carried out working from south to north. When part was finished the temporary roof was removed and timber joists laid at 18in. centres and filled in with "ferrolithic" concrete. This filling was covered with two layers of flooring, a large portion of the timber being maple in order to stand the heavy wear of traffic. When the steelwork of the second floor was finished, the erection of the steelwork of the roof was proceeded with from north to south and followed by the temporary timberwork and the permanent structural work. The roof is covered with "ferrolithic" and two layers of Seyssel asphalt, but, as will be seen from the photographs, there is a large lantern in the centre glazed with wired glass. The vertical part of the lantern is filled with windows on pivots. For the purpose of ventilation these

FIG. 2.—THURSDAY, MARCH 1ST, 1906. View of first floor of Japanning Building immediately after extinction of fire.

trusses so placed that they did not interfere with the erection of the steel columns afterwards. The tie beam, 35ft. long, was composed of 6in. by 1½in. timbers, while the bow, which had a rise of 2ft. 6ins., was of double 3in. by 1½in. timbers, and the bracing of single 3in. by 1½in. timbers, all unplanned and nailed together with 2in. and 3in. French wire nails. In all about 270 trusses were required, and they were covered with ¾in. matchboarding and felt. The drainage from the valleys was effected by means of light cast-iron pipes hung from the trusses and conveyed through the windows to the existing rainwater conductors, and along the eaves a gutter was placed as near to the wall as possible. The trusses are seen in Figs. 3 and 5.

Here are shown the trusses being removed on March 25th, when the second floor was completed and occupation was wanted. The timber used in this roof was 20,000

over 400 tons of steelwork were delivered and erected within one month. The credit of this speedy work is no doubt partly attributable to the architect, who dealt with American ways and means in his designs, and partly to the fine organization of the contractors.

The two sets of photographs following, on pages 6 and 7, record the weekly progress of the building, and are taken from two different standpoints. The method of procedure in erection may be followed by referring to them with the following explanation. As soon as the temporary roof had been erected over the first floor, the whole floor area was relaid with concrete and a start made with the building of stoves, which may be seen in photos Nos. 3 and 4. Hatchways were cut in the roof, and the columns dropped through the holes so formed and fixed to the existing columns of the ground floor. The steel joisting of the second floor] was then placed in position,

are opened by four sets of gearing. Each set operates one-half of the length of each side, or twenty-four windows with a length of about 120 feet. Despite the length of the range, the gearing works so easily that a child can operate it. The building is fitted with the necessary lavatory accommodation for men and women. The ingress and egress doors are of timber, tin-lined, and self-closing in the case of fire. At the south-west corner a fire-escape is provided for emergencies.

The architect for the work was Mr. Robert Whyte, of Glasgow, and the building reflects the greatest credit on him for his foresight in arranging details so that material could easily be obtained. His instructions were ably carried out by a splendid organization on the part of the contractors, Messrs. Robert McAlpine & Sons.

This is not the first feat of rapid construction which Messrs. McAlpine have carried

FIG. 3.—MARCH 25TH. View of interior of first floor, showing temporary Belfast timber roof, the boarding of second floor, and the new japanning stoves.

out at the Singer works. The year before last they built a huge fireproof cabinet factory in less than six months, which we illustrated in our issue for December 28th, 1904. This cabinet factory is 80ft. long by 80ft. wide and 90ft. high, in six floors.

It took 7,000 tons of ordinary concrete, 14,000 tons of "ferrolithic" concrete, 4,000 tons of steelwork, 15,000 tons of timber and 8,000,000 bricks.

With such figures, who shall say that there are not contractors in Great Britain capable

of doing as much, if not more, brilliant work that the American contractors, of whose prowess we hear so much? It is interesting to note that Messrs. Robert McAlpine & Sons have opened a London office at 25, Victoria Street, Westminster, S.W.

Barrack Construction. THE discussion which took place in the House of Commons the other evening regarding the construction of barracks works and buildings for the War Office called forth some interesting speeches. It was, of course, natural that Mr. Haldane should quibble with the dictums of Mr. Arnold Forster and *vice versa*, but the general outcome of the debate seems to have been a considerable consensus of opinion that barrack construction up to within the last year or two has been most inefficient. Our readers may recollect that a good deal of discussion took place in our columns some years ago, in which many correspondents gave instances of the absurd mistakes in construction made by Royal Engineers, who were until recently responsible for the design and construction of barracks. There are many good men in the Royal Engineers, but after all they receive an engineering training, and consequently cannot be expected as a whole to be so conversant with building construction as men who receive an architectural training. Politicians may quarrel about the different policies adopted by various governments, but this is not the only cause of the trouble. Policies may have dictated the expenditure of money upon re-construction or the erection of new buildings, but they have had nothing to do with the inefficiency of the construction adopted. This has been solely due to the mistake of entrusting the work to a body of men not trained specially for such work. It will be within the recollection of most that Mr. H. B. Measures, F.R.I.B.A., the designer of the Rowton Houses, which have been such a phenomenal success, was appointed to take charge of a new department which should have to deal with the design of new barrack buildings and the repair of existing ones. There has not yet been time for Mr. Measures to effect any material changes, and the policy of the present Government seems not to embark upon any large scheme of reconstruction, but the repairs that will necessarily have to be carried out will no doubt render the existing places more efficient if left in the hands of an architectural staff.

Mr. Shaw and the Shopkeepers. WE referred last week to the opposition of the Regent Street shopkeepers to Mr. Norman Shaw's fine scheme for the rebuilding of Regent Street Quadrant. We are glad at any rate to see that Mr. Shaw does not intend to compromise. When interviewed by a representative of the "Morning Post," he said: "Of course, my own position is unassailable. The whole thing has been done by the Government, who had approved my design long before this trouble came. The Treasury approval was obtained quite a year ago, though it was officially communicated to the Office of Works only last month, I believe. A tremendous amount of nonsense has been talked about this affair. It is an

interesting fact that those who prepared the original plans for the Piccadilly Hotel, the front of which adjoins the Quadrant, objected to my design, though it actually gave them three feet more plate glass for the shops underneath the hotel than their own plans. With a view of squeezing in as many as possible their shops were to be only 14ft., which I am perfectly certain is far too small. Indeed, it is the subject of complaint now that many of the existing shops in Regent Street are too small. After a good deal of trouble it was arranged that the size of the shops should be increased to 20ft. and that governs the whole design for the rebuilding of the Quadrant. Each bay will have 17ft. width of glass, and surely that is sufficient for any reasonable person who does not ask for glass down to the pavement and up to the moon. The hotel people are getting the shops built as quickly as possible, so that they may be ready for occupation before the hotel is completed, and the way in which those shops let or do not let will be a pretty good test of the value of the objections that have been raised." Mr. Henry T. Hare, F.R.I.B.A., was also interviewed by the same journal, and his opinion on the subject is worth recording; it will generally be endorsed by the architectural profession. He says: "I regard it as mistaken commercialism. Surely the goods in a shop window look very much better in an artistic frame than if they are displayed with nothing but plate glass in front of them. In my opinion the whole idea on which the objections are based in sheer nonsense, and it is quite time that a very firm stand should be taken against any attempt to ruin architecturally the plans for the rebuilding of the Quadrant which have been adopted by the Office of Works and are being carried out. Those who do not realize what Mr. Norman Shaw's buildings will look like when completed may perhaps consider his treatment rather severe; but on the whole it is a very fine piece of architecture. There never was a design, however fine, that was not open to some criticism, but I think we ought to be extremely thankful to Mr. Norman Shaw for the way in which he has produced one harmonious whole with cornices unbroken and the frontage carried, as it will be, over Air Street and Glasshouse Street on piers. It is admitted that Regent Street must be rebuilt, and as far as the Quadrant is concerned it could not be done better than in the way proposed." We hope that the opinions thus put before the public will cause the opposition to cease, because it would be altogether too scandalous if the scheme were abandoned or in any way curtailed simply to suit the whim of a small and unimportant section of the public, whose desire is to see altered for their own ends a design which if carried out as now proposed will be an admirable addition to the architecture of London.

NEW OFFICES FOR NORTH-EASTERN RAILWAY COMPANY, YORK. HORACE FIELD, F.R.I.B.A., AND WILLIAM BELL, F.R.I.B.A., JOINT ARCHITECTS.

This block of new offices for the headquarters staff of the North-Eastern Railway Company has been in course of erection during the past five years. The exterior of the building is now finished, but inside the work of fitting up and decorating is still proceeding; it is expected to be completed by September. Altogether there are 183 rooms, the largest being the board-room on the first floor. Mr. Horace Field, F.R.I.B.A., of London, and Mr. William Bell, F.R.I.B.A., of York, (chief architect to the company), are jointly responsible for the design.

HINTS TO USERS OF POLISHED GRANITE.

By P. W. Abbott.

IN commercial usage the term "granite" includes a number of the Plutonic rocks, ranging from fine-grained diorite at one extreme to coarsely-crystalline iridescent labradorite at the other; but all have a common origin, all have been at one time molten, have slowly cooled and crystallized under extreme pressures, and the basis of all is silica—quartz, feldspar, mica and other silicate compounds. In museums and other collections the labels to the various specimens bear curious polyglot names, difficult to pronounce and spell. These names are not permanent, nor are they always uniform. Geologists, though not to the same extent as botanists and conchologists, are fond of christening their own and other people's babies, and a very small child sometimes bears an astonishingly big name.

This basis of silica gives to granite its unique excellence as a building stone. It is tough, homogeneous and untouched by the acids of the atmosphere. Indeed, most members of the group are insoluble, except by hydrofluoric acid. Owing to crystallization having taken place in huge masses and under high pressures from all directions, granite is free from bedding, and the fractures caused by strains and stresses set up during the cooling and contraction of the

earth's crust do not affect the strength and solidity of the individual masses.

Having a common geological origin, granites from widely different districts are practically indistinguishable, except to the expert, and often he may be unable to fix the locality of a specimen. Grey granite of the Cornish type is found on the Continent and in America. Labradorite, originally discovered and christened in Labrador, forms huge mountains in Norway. The fact that similar grey and red granites are found in the West of Scotland and east of Ireland, in Cornwall and Portugal, is not so striking, for the beds probably are, or have been, continuous. This means that by insisting strictly upon granite from a particular quarry the buyer may be excluding material of an exactly equal quality, strength and colour.

Granite, therefore, is primarily a structural, weight-carrying stone. Its renowned decorative effects are secondary characteristics. This, it is submitted, gives the key to its architectural use. It is hard and intractable, yields only to severe methods of working, does not lend itself readily to ornate treatment, but it is imperishable. It follows therefore that designs suitable to the material should be simple and bold, broad in scheme and in execution. By the inherent fitness of things an architect will no more put on to granite a wealth of moulding and decoration which would be reasonable only in soft stone than he will design a town hall in the

style of a pier pagoda—that is, unless he has a client of extreme generosity, unlimited means and peculiar taste.

A short sketch of the processes of masonry and polishing granite will emphasize this point. To commence with the sawing. In freestone quick-running saws will cut 8 ins. or 9 ins. per hour with half-a-dozen or half-a-score blades. Upon granite about 1 in. per hour with one blade, or $\frac{1}{2}$ in. or $\frac{3}{4}$ in. with two or three blades, is as much as has hitherto been found practicable without damaging the straightness of the cut. With higher speeds the saw blades are apt to buckle, and subsequent hand labour is necessary to make the face true. The masonry of plain faces probably takes eight or ten times as long as freestone, but here pneumatic surfacing machines are useful, especially where the surfaces are not under, say, 6 ft. super. each. Circular work which may be done in lathes is as comparatively costly. In the masonry of moulding the comparison is worse, for there is no machine to correspond with the moulding machines for stone. An attempt has been made to cut granite with a high-speed abrasive wheel, shaped to the desired mould, but hitherto without much success except for very small moulds. The abrasive material either glazes and does not cut, or it cuts the granite and wears itself out of focus at the same time, so spoiling the design and the jointing. Plain surfaces to be polished are, after masonry or sawing,

ground down by heavy iron or steel rings fed with shot, are fined up by similar rings fed with carborundum or emery, and are glossed by feet rings and putty powder. Each face will take perhaps a day and a half for the entire process, the greatest possible care being required to avoid any unequal grinding. The difficulty of securing absolutely true faces is seen particularly in the jointing of stones which have three or more faces polished—pier stones, for instance. With the utmost care inequalities—small, singly, but multiplied by the number of faces—are revealed in the fitting, and paring and repolishing by hand are necessitated. Plain faces, however, are simple by comparison with moulding, especially circular moulding. This is first masoned by hand, then a plaster model is taken from which iron castings are made. The moulded stones are then set before the "sliders," huge pendulum arms from which run rods connected to the castings. As the pendulums swing backwards and forwards the castings are rubbed to and fro along the mould, and the grinding, fining and glossing proceed as in plain faces, but much more slowly, the time required being about three days. The difficulty of securing true joints is also greater, particularly in fine and in circular moulds, and the expense of paring and repolishing is correspondingly increased. A stone with two or more moulded faces of course takes a proportionately longer time, as one face only can be polished at once. Large moulds can rarely be polished in one process, and two or more operations may be necessary. Sunk and undercut work is naturally much more costly, especially when hand-polishing is required. This hand-polishing is the bugbear of granite workers. Small sunk faces, bull-noses, returned ends and other short lengths and surfaces having to be polished by hand run up the cost of the finished job to an almost incredible extent, and to the inexperienced eye there is little to show for the money. Carving of figures, faces, floriated designs or other elaborate work is not generally polished, but is always slow and costly, in spite of pneumatic chisels.

On the other hand, granite has the virtues of its defects. It is costly to work, but its crushing strength is 1,000 to 1,200 tons to the square foot. Once the work is well done it remains good. The arrises and the members of the moulds, not to speak of plain faces, not being affected by the weather, remain perfectly sharp and true, and an architect is spared the mortification of seeing his most cherished conception fading before his eyes. Even the polishing is imperishable, if only the accumulation of soot and more or less acid dirt is periodically removed by cleaning—once or twice a year, even in smoky towns, will almost suffice. No other material is so effective, so durable or so suitable for use in busy thoroughfares. Even dressed granite is far better than any other stone, for it can be cleaned without rubbing away the surface, is impervious to the weather, and, nowadays, is little more costly than good freestone.

From the foregoing brief sketch two or three practical conclusions may be drawn. The first is that if the granite worker is to have a reasonable chance of turning out good work, ample time should be allowed for delivery. As a matter of fact, this is rarely done. The granite is invariably required when the foundations of the building reach the street level, but too frequently this is one of the last of the structural contracts to be settled, and cases are not unknown in which the builder is ready for the granite before all the full-size details are prepared. For a contract containing anything but the plainest work and of 250 ft. super. or upwards, ten to twelve weeks is really little enough time to allow, though by incurring extra expense and by risking the quality of the workmanship earlier delivery may be

given. For jobs containing 1,000 cub. ft. four to six months should be allowed.

A second point is that drawings or sketches should accompany all quantities. This apparently self-evident rule is by no means always followed, and the poor granite mason, without any sketch to guide him, has to price out such items as—

"ft. run, sunk, moulded and panelled and moulded semi-circular arches, wide, on bed, diameter."

Such quantities alone are almost useless and to tender upon them is pure speculation. Nor are eighth-inch scale drawings adequate, unless helped out by ample full-sized details,

and though the suggestion that sections and plans should accompany all elevations may appear somewhat impertinent, it is justified by painful experience.

Granite masons sometimes incur an amount of obloquy on account of late delivery or other fault, part of which is perhaps richly deserved. No sub-contractor, however, lays himself open to the censure of architect or builder if he can help it, and a better appreciation of the time required for the turning out of satisfactory work in polished granite will help to prevent the delays and misunderstandings which sometimes occur.

This front is to be of Portland stone and zin. Dutch bricks, the roof to be covered with hand-made thick red and brown pantiles, with stone ridge, elm box gutter covered with cast ornamental lead, with wrought-iron brackets and cast-lead heads; the door and shop front to be of oak. The architect is Mr. William Hunt, of Donnington House, Norfolk Street, Strand, W.C.

EXPERIMENTAL SCIENCE AND THE BUILDING TRADES.

ON Monday last, at the London County Council School of Building, in Fern-dale Road, Brixton, Mr. Alan E. Munby, M.A. (Cantab), F.C.S., gave the second of two lectures on "Experimental Science, and what it has done for the Building Trades."

In the first lecture, delivered on June 11th, Mr. Munby dealt with his subject on broad lines, in its relation to pure science. He pointed out that the man of science tried experiments upon matters as yet unknown, not at random, but in accordance with some previously thought-out scheme. The solution of any problem, however, involved much work, often much apparently fruitless work, and this did not end with the experiment, for it was usually only after a careful collection and arrangement of the results of a series of experiments that any real outcome was apparent. A fact was established, and out of that fact grew a theory. A theory was a guess, not a haphazard one, but a careful conclusion, carrying with it at least some probability of truth. The theory had now to be put to the test, by fresh experiment, and if the results were explained by the theory, it stood justified, until at last it was raised to the position of a newly discovered law of nature.

The Inception of New Industries.

How was it that such enormous advances in all natural knowledge had been made during the past century? Not because of mechanical skill; evidence of great powers in this direction were readily obtainable from past ages. Neither was it through fortuitous circumstances, nor owing to the demands of mankind. It was the discovery of natural laws by the man of science, resulting in the technically-trained mind being enabled to find a structure on which to raise new industries. No builder grudged his scaffolding; he knew that although it must be erected to be pulled down, it would pay in the end; and it was equally true that a little time spent on the acquirement of the principles of science with a view to an improved knowledge of materials would do the same. This was taking a purely commercial view of the matter, but the days were gone by when a man studied merely to increase his immediate wage value; the attendance at our technical and trade schools meant much more than this; it meant an awakened interest which made the difference between the man who lived in his work, and wished to probe it to its foundations, and the man who was a mere machine, and whose work was irksome to him, because he shut out from it all the knowledge he could. Lastly, there was the consideration of science from a national standpoint. The work of the laboratory to day bore fruit in the workshop tomorrow, and it was in those countries where pure science received the greatest attention that new industries chiefly arose. Although it would be incorrect to say that there existed no great factories which had flourished in the past on rule-of-thumb methods and long experience, there were few, if any, which could afford to neglect scientific methods at the present day. As one illustration of this we might turn to

The Cement Industry in Germany, steadily advancing by reason of scientific study, and though we had reason to congratulate ourselves upon the able methods employed by home manufacturers, a number of valuable prizes were now being offered in Germany for essays on the chemical actions which take place in the manufacture and use of cement, thus giving a stimulus to research which would probably lead to such an exact knowledge of the necessary composition of cements for various purposes that German cements were not unlikely to appear in the forefront of the market.

The branches of science which chiefly concerned building were physics, chemistry and geology.

Continuing, Mr. Munby dealt with chemical principles, compounds and changes, it being shown that decay in materials was the result of such changes.

At the outset of his second lecture Mr. Munby said that the value of a study of chemistry to the builder was evidenced by the fact that the decay and deterioration which took place in building materials were the result of chemical processes. The chief agents in furthering these changes were air and water, which, however, must act together to produce results. That might be easily shown by keeping one piece of bright iron in perfectly dry air and another in water from which all dissolved air had been expelled by boiling, and air, of course, subsequently excluded by placing the water in a stoppered bottle or other suitable vessel. Nearly all forms of decay were due to the slow chemical combination of oxygen, generally derived from our moist atmosphere, with some part of the material in question, resulting in a splitting up of the substance into simpler compounds, or, as in the case of metals, in the formation of compounds of oxygen (and probably also hydrogen from the moisture) with the metal, forming rust, the process being chemically known as oxidation.

Combustion and Fire Prevention.

The process of oxidation above referred to, like nearly all chemical changes, was accompanied by an evolution of heat, and though this was not usually apparent by reason of the slow nature of the change, which allowed the heat to be dissipated before the temperature could rise appreciably, in certain cases the change was so rapid that the material actually became hot enough to take fire. Fires of this nature had frequently been known to occur in heaps of cotton waste partially saturated with oil, in coal mines due to the rapid oxidation of coal dust, and through a similar cause in flour mills, the combustion indeed in these latter cases being so rapid that an explosion generally occurred.

For combustion, which might be defined as chemical action accompanied by light and heat, three conditions were necessary—(1) something which would burn; (2) something (generally air) in which the substance could burn; and (3) sufficient heat to start the burning. Fire might therefore be prevented by removing the possibility of all three conditions being existent at the same time. The most obvious method of preventing fire was to provide no combustible substance, as for example by the use of steel and concrete. It was, however, equally efficacious, and often more convenient, to prevent or at least hinder the access of air to combustible materials. The use of floors composed of joists laid in immediate contact, and of solid hardwood treads for stairs, depended upon this principle. In like manner the more rapid burning of soft wood was due to its porosity, the pores being filled with or giving access to air. A fire in a building possessing incombustible walls and roof would soon be extinguished if the apertures could be closed, say with tightly-fitting iron shutters, without any need for water, which often did more damage than the fire itself; and this method of prevention could be further aided by placing in the building vessels containing liquified carbon dioxide (which did not support combustion), such vessels being given facilities for breakage by the fire, when their contents would turn into gas of considerable volume.

Dealing with the physical properties of materials, Mr. Munby said that although a solid body did not usually appear to possess any hollow spaces in its interior, yet it was not really absolutely continuous. It con-

sisted of an assemblage of very minute particles, each of which had a certain limited freedom of motion, and between which were spaces, though these were too small to be revealed by the most powerful microscopes. That these particles, or molecules as they were called, must be very small, was evident from the thinness to which certain things could be brought, as, for instances, a soap bubble and gold leaf, the latter being easily obtainable of less thickness than four-millionths of an inch, so that the molecules could not have a greater diameter than this. These molecules were formerly thought to be spherical, but mathematical reasoning indicated that they more probably took the shape of rings of circular section. Since solid bodies retained their shape there must be some force which held the particles together, a property of solids which was termed "cohesion." It was upon the amount of cohesion that the value of many building materials depended. In a few bodies it was almost nil, but usually it was considerable, as in the cement briquette which the lecturer proceeded to put to the test, measuring its cohesion by the pull in pounds required to overcome this force and break it in two.

Heat as affecting Cohesion.

Heat caused or, perhaps more strictly, was internal vibration which made the molecules of a body move through bigger distances and increased their rate of motion. If this were true we should expect materials to swell when heated because the interspaces between the molecules must be thereby increased. This, indeed, was what took place, and the expansion of materials under heat had often to be allowed for in building. A 30ft. steel joist, for example, might easily be $\frac{1}{4}$ in. longer in summer than it was in winter, and with long lengths of materials this consideration therefore could not be overlooked. Perhaps the most striking instance of such expansion would be found in the Forth Bridge, which was about a yard longer in midsummer than in midwinter. This expansion was very simply shown by fixing one end of a rod or tube of metal and placing the other upon a needle, laid on its side, to which a long light pointer was attached. On warming the rod it rolled the needle round by its expansion, which was evidenced by the motion of the pointer. If the heating of a body were carried far enough the cohesion would be entirely overcome and the body melted.

Crystalline and Amorphous Structure.

The molecules of certain substances had the power of aggregating themselves into definite shapes if allowed to collect freely, as when a melted substance solidified or a solution evaporated. Such aggregates were called crystals. Many substances had a crystalline structure which considerably influenced their weathering and cohesive powers. Marble and chalk had the same chemical composition, but their great difference was mainly due to the crystalline character of the former, the interlocked nature of its particles giving it greatly increased strength and powers of resistance to weathering and abrasion. By projecting on to the screen images of several rock sections with the aid of the lantern microscope, the lecturer showed how very different in physical character were many well-known building stones, and although we could hardly show the method of the formation of those having a crystalline structure, which in most cases were formed from molten or highly heated materials, it was possible with the aid of the lantern to show the method of growth of crystals by the evaporation of solutions of substances which crystallized.

Though this interlocking structure often assisted cohesion, it was not inseparable from it. Many substances consisted of rounded grains held together by some actual cementing material. Again, bodies of organic

origin, such as timber, possessed a cellular structure which might be of considerable strength. The breaking down of this structure by decay, causing rot in the timber, might be detected by taking advantage of another physical property of solids. All solid bodies which had a homogeneous structure conducted sound very readily, much more readily even than air. The ticking of a watch could easily be heard through a sound piece of timber 30ft. or 40ft. long, but if it was decayed the change in the material would interfere with the sound waves, which would not be transmitted; and this simple test was often of great assistance in the selection of timber.

R.I.B.A.

The following is the list of officers and council of the Royal Institute of British Architects for the current session, elected at the last business meeting:—

President.

T. E. Colcutt.

Vice-Presidents.

Henry T. Hare

Leonard Stokes

Hon. Secretary.

Alexander Graham.

Members of Council.

Reginald Blomfield

J. J. Burnet

W. D. Caroe

A. W. S. Cross

E. Guy Dawber

William Flockhart

Ernest George

J. A. Gotch

E. A. Gruning

Associate Members of Council.

H. A. Crouch

W. A. Forsyth

Representatives of Allied Societies.

H. Dare Bryan (Bristol)

H. S. Chorley (Leeds and

Yorkshire)

Edmund Kirby (Liverpool)

W. M. Mitchell (R.I.A. of

Ireland)

J. M. Munro (Glasgow)

Representative of Architectural Association.

R. S. Balfour.

868 papers were returned for members of council and 832 for associate members.

OUR PLATES.

Doddings Farmhouse, Bere Regis, Dorset.

THIS farmhouse has recently been built to replace an old house in the last stage of dilapidation. The site was somewhat confined, and regard had to be paid to strict economy. The house is rather larger than would usually be the case, but the value of the farm is considerably augmented by very fine watercress beds, which have been practically entirely formed, and developed by the present tenant, Mr. William Bedford. Advantage has been taken of a particularly interesting brick made

within a few hundred yards of the house by the tenant. These bricks have three or four slight gradations in colour, and the face-work has been built to give play to these variations. Fired headers have been used in the jambs of windows, the chimneys and gables. For the roofs old tiles have been used as far as practicable, and the general aim has been to make the design characteristic of farmhouse work and as simple and unpretentious as possible. The fireplaces are all built with the same local bricks, mixed with roofing tile and with plain red 6in. floor tiles as hearths. In effect care has been taken throughout to minimize the cost of upkeep and to provide the estate with a substantial and comfortable dwelling fitted for and expressive of its purpose. The total cost was £1,004. The builders were Messrs. Parsons & Hayter, of Swanage, whose foreman, Jim Heath, produced a fine piece of brickwork indicative of honest craftsmanship. The work was carried out from the designs and under the superintendence of Messrs. Forsyth & Maule for the late Mrs. Erule Erle Drax, of Charborough Park.

THE TOWERS ON THE NEW GOVERNMENT BUILDINGS.

IN the House of Commons last week Mr. Whitwell Wilson asked the First Commissioner of Works whether he had received any representations respecting the towers which appeared upon the drawings of the new Government buildings facing Great George Street; and whether he was prepared to authorize the construction of any or all of those towers.

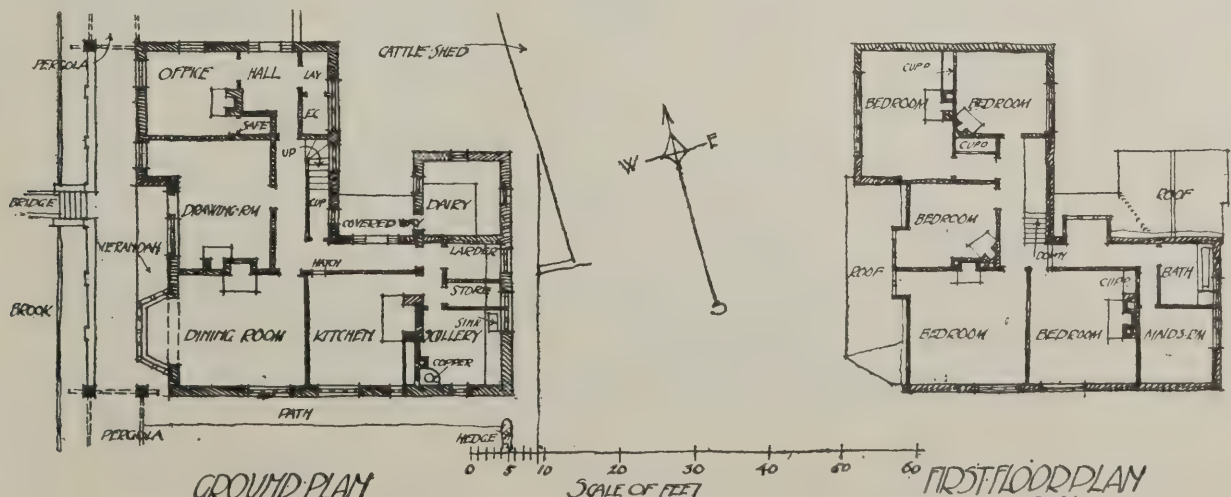

Mr. Harcourt said in reply: "Yes, sir; I received a strong representation from the council of the Royal Institute of British Architects in favour of the completion of the towers on the Great George Street front of the new public offices. I replied to them in the following letter: 'I am much obliged by your letter of the 25th. Though I maintain my own opinion that the proposed very high towers on the Great George Street front of the new public offices are not architecturally or aesthetically desirable, I am not prepared to put my artistic opinions against those of the council of the Royal Institute of British Architects. I have therefore given immediate instructions that the single tower of the building now in course of construction shall be continued and completed on the lines originally laid down by Mr. John Brydon. I need not say that I shall always greatly value any criticism or assistance that the Institute is good enough to afford me in that part of my duties which is connected with architecture.' I may add that I have asked the contractors to see that, as far as possible, the masons to be engaged on this work shall be those who were discharged on its sus-

pension, and the contractors have promised to meet my wishes."

This we consider to be satisfactory. It is highly desirable in all these cases of important Government buildings that the architect's design shall be carried out in its entirety.

A NOTE ON THE KING'S SANATORIUM.

THE King's Sanatorium, near Midhurst, in Sussex, which was opened last week, is a very notable building, both as a piece of brickwork design and as embodying the latest principles in the planning of a sanatorium. In a building of this kind, even perhaps more than in an ordinary hospital, there are a great many points governed by medical or other requirements which have to be taken into account in the planning by the architect. For a sanatorium the ruling requirements are ample sunlight and pure air, and the absence of dust of any kind. The plan of the building at Midhurst is pretty well known to most of our readers, having been published in our columns some time ago. There is nothing of exceptional importance in the north or administration block; it is the south or patients' building, comprising a centre portion with side wings, which forms the chief interest. The bedrooms are arranged on two floors with a well-ventilated corridor running behind, and each has French casement windows opening on to a balcony. All corners are rounded off to prevent the collection of dust, and every precaution has been taken with the furniture to secure the same end, the wardrobes even having rounded tops. The centre block of the patients' building is carried up one floor higher than the wings, and on this top floor will be accommodated those patients of the poorer class who are too ill to leave their beds. Below them, on the first floor, are the bedrooms (14 in number) for the well-to-do patients, who will pay a fee of £8 8s. a week, while the other patients in the wings will be taken at £2 2s. One of the most interesting features of the building is the heating of the dining-hall and of the open-air chapel. This is on the old Roman system, the floor itself, laid with York stone slabs, being heated by steam pipes in channels below. The chapel is of course quite unique and altogether a delightful example of modern design. We give an illustration of it on the next page, from a photograph by Mr. E. Dockree, which illustration is one of thirty given in this month's issue of THE ARCHITECTURAL REVIEW, accompanying an article on the building by the architect, Mr. H. Percy Adams, F.R.I.B.A. The cost of erecting and furnishing the sanatorium has not, we understand, fallen far short of £140,000.

DODDINGS FARM, BERE REGIS, DORSET. W. A. FORSYTH AND H. P. G. MAULE, ARCHITECTS.

THE CHAPEL AT THE KING'S SANATORIUM, NEAR MIDHURST SUSSEX. H. PERCY ADAMS, F.R.I.B.A., ARCHITECT.

NOTES ON COMPETITIONS.

New School at East Wemyss.

In connection with this competition, the conditions of which were criticized in our issue of May 23rd last, some information is forthcoming which, if true, is little short of scandalous. The competition is an open one, and was duly advertised as such, no mention being made of any prescribed boundary for competitors. It is therefore alarming to learn that it is a well-known fact in the neighbourhood of East Wemyss that only from competitors practising in that vicinity will the architect be selected who is to be entrusted with the work. Local architects appear to have satisfied themselves that the competition is sound, in spite of the condition that "the Board does not bind itself to carry out any one of the designs submitted." So far as they are concerned, well and good; but what about non-local competitors? They will find themselves in a helpless position, for the selection of drawings is to be made, in the first place, by the Board, who will afterwards submit their selection to the adjudication of the Scotch Education Department, whose decision will be final. No provision was made in the conditions for a professional assessor, but it has been ascertained that if the Education Department refuse to adjudicate, an assessor will be appointed. In view of the assertions already made, it may readily be assumed what plans will be submitted for his opinion. There is comfort in the hope that the necessity of visiting the site and preparing a block plan for their own use, as required by the conditions, may have precluded many intending competitors outside the local area from preparing a scheme. The comparative insignificance of the building renders this more than probable; even comment were undignified but for the serious question of principle involved. A Scottish competition is, as a rule, an uncertain quantity; it is interesting to know that this one is regarded by local architects as superior in quality to anything that has been hitherto presented in that part of the kingdom.

Birmingham Council House Extension.

The designs of the ten selected architects in this competition are to be sent in by the middle of November, and it is probable that the award will be made in the following month.

Two Resolutions.

At the last business meeting of the Royal Institute of British Architects the following two resolutions were brought forward by Mr. K. Gammell, A.R.I.B.A.:—

"That, in view of the fact that limited competitions are a great injustice to the young and unknown members of the profession struggling for recognition, and also not in the best interests of the promoters, this Institute declares that competitions should not be limited, and that such steps should be taken as may be deemed advisable to discourage public bodies from instituting such competitions."

"That the Institute exert its influence in obtaining the abolition of the growing custom of penalising non-acceptors by retaining their deposit."

In bringing forward the motions Mr. Gammell, without making any personal references, cited four competitions which had been limited, but which, he contended, should have been open—namely, the Queen Victoria Memorial, King's College Hospital, the University College of North Wales at Bangor, and the Luton Secondary School.

Some discussion took place and it was suggested that the matter should be referred to the council: eventually, Mr. Gammell agreed to bring forward the motions at another meeting, in an amended form.

Hove Library.

In the second competition for this library the following recommendation has been made by Mr. John Belcher, the assessor:—1st, Messrs. Percy Robinson and W. Alban Jones, of Leeds; 2nd, Messrs. A. J. Hardwick

and Sydney E. Castle, of Kingston-on-Thames; 3rd, Mr. Lionel U. Grace, of London, W.C. This recommendation has been approved by the library committee, provided the tender for the design placed first does not exceed £9,333. It will be remembered that the first competition was abortive. The premiums in the second competition were £50, £30 and £20 respectively.

Competitions Open.

The following is a list of competitions open:—

DATE OF DELIVERY.	COMPETITION.
June 26	NURSING AND CONVALESCENT HOME AT GLOSSOP, to cost £6,000. Premiums of £20 and £10. Particulars from Mr. T. W. Ellison, town clerk, Norfolk Chambers, Glossop.
" 30	ELEMENTARY SCHOOL AT EAST WEMYSS. Particulars from Mr. A. Watson Taylor, clerk to the School Board, East Wemyss, R.S.O., Fifeshire.
July 2	SECONDARY SCHOOL FOR GIRLS AT AIGBURTH VALE, for the City of Liverpool Education Committee. Limited to architects in Lancashire and Cheshire. Particulars from the Town Clerk, Municipal Offices, Liverpool.
" 4	SCHEME OF SEWERAGE AND SEWAGE-DISPOSAL WORKS AT WARBLINGTON. Premiums of £100 and £50. Particulars from Mr. J. W. Loader Cooper, clerk to the U.D.C., Queen Street, Emsworth.
Oct. 1	ALPHABET COMPETITION. Prizes of £20, £10 and £5. For particulars see "Architectural Review."
" 31	BOURSE AT CAIRO. — Premiums of £250 and £100. International competition. Designs to be submitted to the "Corporation des Agents de Change," Cairo, Egypt.
—	NEW MUNICIPAL BUILDINGS AT STIRLING (to cost £12,000). Premiums of £100. Particulars from Town Clerk, Borough Buildings, King Street, Stirling.

Obituary.

The late Mr. George Low, architect and surveyor, of London, left property valued at £16,000.

The late Mr. Edmund Woodthorpe, F.R.I.B.A., of London, E.C., left estate which has been proved at £10,744.

Mr. W. D. Church, senior partner in the firm of Messrs. Church & Sons, architects, of South Place, Finsbury, died recently.

Mr. William Pattinson, head of the firm of Messrs. W. Pattinson & Sons, contractors, of Ruskington, near Sleaford, died recently, in his seventy-third year.

The late Mr. John Dibble, head of the firm of Messrs. Dibble & Sons, builders, of Birmingham, who died on January 30th, aged 66, left estate which has been proved at £73,782.

Mr. E. E. Scrivener, senior member in the firm of R. Scrivener & Sons, architects and surveyors, of Hanley, died recently in his sixty-eighth year. A great deal of school work was carried out from his designs.

R. San. Inst. Bristol Congress: Programme.

—The preliminary programme of the twenty-third Congress of the Royal Sanitary Institute, to be held in Bristol from July 9th to 14th, has now been issued. The president of the Congress is Sir Edward Fry. In section II., "Engineering and Architecture," presided over by Mr. Edwin T. Hall, V.P.R.I.B.A., papers will be read on "The Construction of Isolated Homes for the aged poor *versus* the Workhouse," to be introduced by Mr. A. Saxon Snell, F.R.I.B.A. There will be seven special conferences, including one of engineers and surveyors dealing with "Rural Road Construction and Maintenance," and another of sanitary inspectors dealing with "The Advantages of Public Abattoirs."

Enquiries Answered.

Questions should in all cases be addressed to the Editor and be written on one side of the paper only.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters.

Correspondents are particularly requested to be as brief as possible.

The querist's name and address must always be given, not necessarily for publication.

Shop Windows.

BIRMINGHAM.—F. N. S. writes: "I am asked to give an estimate for roller shutters to five windows about 12ft. by 8ft. for a jeweller's shop. Please name a good firm who can supply these. My client wants the newest design."

We think that the Kinnear roller shutter, supplied by Messrs. A. L. Gibson & Co., of 19-21, Tower Street, Upper St. Martin's Lane, W.C., will serve your purpose.

Architectural Appointments in the Indian Government.

LONDON.—INDIAN GOVERNMENT writes: "(1) Is there an Architectural Department in connection with the Indian Government? (2) How can I get information regarding same? (3) Are examinations required to be passed in order to gain admission to the Service?"

There are no architectural appointments open to competitive examination in the Indian Government. If you are anxious to get an appointment in the Government Service you should write to the secretary of the Civil Service Commissioners, Burlington House, London, W., asking for particulars of all examinations requiring a knowledge of architecture, when, from the particulars supplied, you will be able to see which examination suits you best. H. Y. M.

Architectural Models.

LONDON.—X. writes: "Please name firms who undertake the preparation of models for light and air cases."

Mr. John B. Thorp, London Drawing and Tracing Office, 98, Gray's Inn Road, W.C.

Buildings to Measure in North Wales.

MACCLESFIELD.—ENQUIRER writes: "Please give me some information about Gothic buildings to measure in North Wales."

The following is a list of buildings containing features suitable for measuring up in North Wales:—St. Mary's, Shrewsbury; Abbey Church, Shrewsbury; Old St. Chad's; Wroxeter; Oswestry; Ruabon; Wrexham, tower and apse (Perpendicular); Guesford, tower (Perpendicular); Northop, tower and effigies; Mold; Cilcain, roof; Llanarmon, monuments and chandelier; Llanfwnog, arcades; Ruthin, roof; Llanrhaidr, window; Efenectyd, wooden font; Llanrwst, Gwydyr chapel, very fine Perpendicular rood loft; Whitchurch (Perpendicular); Conway; Beddgelert, old Priory Church (Early English); Clynog, roof, tower, St. Beuno's chapel; Beaumaris, carving; Llanestyn, font (Early English); Llanvihangel, pulpit; Llanddymnan, sculpture; Holyhead, sculpture; Llangadwaladr, windows; Llanaber (Early English); Llanasa, stained glass; Gualsfield, roof (restored); Newton, old screen in modern church; Llanidloes, roof; Pennant Melangell, screen; Llanmer, roof; St. John's, Chester, double row of triforium arches. H. Y. M.

Plaintiff and Defendant.

SOUTH BANK.—W. S. A. writes: "Plaintiffs' affidavit correct and can bear witness. Defendants' affidavit absurd. Witness in defendants' employ, and threatened by

defendants if he gives such evidence will be instantly dismissed. (1) Do defendants commit themselves disregarding witness's position? (2) Is there any way left for plaintiff to get witness, if he refuses, to swear to an affidavit? (3) If summons is withdrawn, can a new summons be taken out later?"

Your question is not very clearly stated, but I gather that you wish to secure the evidence of someone who is in your opponents' service, and who therefore finds himself in a difficult position. You cannot oblige him to make an affidavit if he does not so desire, but you can serve him with a "subpoena" to appear in court, and so oblige him to give his evidence. Your solicitor is your best guide in a matter of this kind, and you should not do anything without his knowledge and approval.

F. S. I.

Temple of Eleusis; Ornament in Uffizi Gallery.

SUNDERLAND.—R. S. writes: "(1) What is the exact height, in modules, of the column of the Greek temple at Eleusis? This is not given in Spiers' 'Orders' nor in Banister Fletcher's 'History.' Also, where can I get a description of the building? (2) Would a portion of the cast of Roman ornament from the Uffizi Gallery, Florence (illustrated on p. 2, plate 9, of Glazier's 'Manual of Historic Ornament') be suitable for the freehand testimony of study for the R.I.B.A. intermediate examination? If so, what sort of a written description of it should I have to give for the above?"

(1) Of the fragments that remain of the temple, and indeed of the propylæa and tower of Eleusis, there is but little to indicate the dimensions of the various parts of the buildings in which they originally had their place. The capital, base and entablature of the Ionic temple at Eleusis as restored will be found in Spiers' 'Orders' as copied from Mauch, but the exact height of the column is not known. Plate XXI. of Spiers' 'Orders' shows a small complete drawing of this Ionic Order which may be taken as approximately accurate. A short description of this temple and of the propylæa will be found in Spiers' 'Architecture East and West' and in the 'Architectural Dictionary' under Eleusis. (2) A portion of the cast of Roman ornament from the Uffizi Gallery, Florence, referred to above, is very suitable for the Classic Ornament testimony of study for the R.I.B.A. intermediate examination. This should be drawn to a large scale to fill your sheet unless you propose to draw other examples as well. It does not appear to be known from what building the ornament was taken, so you had better write a few notes as to the character of Roman ornament by way of description.

H. Y. M.

Tiled Valleys.

X. X. writes: "We are trying the old method of laying tiled valleys as set forth in your issue for May 16th, but find difficulty at the ridge and eaves. Which is the correct method of laying here, and have you any particulars as to how much the old men hired up?" Tracing sent (not reproduced).

You have chosen a rather unfortunate example for experiment in the old-style tiling, and I can well understand some of your difficulties. Dealing with the points in order:—(a) In the old tilework which I can recall I know of no case where ridges intersect at one level—in every instance one is subsidiary, and runs out against the slope of the higher roof, in which case the junction solves itself quite naturally. The actual ridge-tile of the lower roof is tilted upwards against the higher slope, the plain tiling of which is eased in a gently diminishing swell for three or four courses above same. With a level intersection I do not believe it is possible to produce an entirely satisfactory

job or to dispense with lead, cement, cutting and other makeshifts. (b) The finish of valleys at the eaves (particularly in such an example as shown on the tracing) does not appear to present any serious difficulty, as this again only becomes awkward when a level eaves-gutter is required round the angle. Even then it is readily surmounted. Perhaps I can best illustrate by referring to examples, of which there are several (executed in stone slating) at Stamford. A good one is the "Bull and Swan" (I think) in St. Martin's. (c) The extent to which the valleys need be fired depends upon the pitch of the roofs—with a flat pitch firing is hardly necessary at all, but with the pitch of 50 degs., which is usual in old work, it is sufficient to start the sweep of the tile courses at about the fifth tile on either side of the valley.

E. G.

Roof for Hall.

Roof writes: "I send plan of a hall (not reproduced) which I propose roofing with 7in. by 3in. spars at 18in. centres, 6½ by 2½ tie-beam bolted to spars, and spars notched to 6 by 3 wall-plate at foot. What is your opinion on the matter? As the hall is a very cheap building I do not want to go to the expense of principal roof if it can be avoided."

The roof proposed is what is known as a close-coupled or couple close roof, and should not be used for more than 18ft. span. As the span in this case is 24ft. 6ins. some other means must be adopted. The pitch of the

roof is not stated, nor the nature of the covering, whether slates or tiles, nor whether a ceiling is to be provided for. Assuming a pitch of 30 degs. and the roof to be slated and a ceiling carried, the construction may be modified as shown in Fig. 1, for which Fig. 2 will be the frame diagram and Fig. 3 the stress diagram. If there is no ceiling, one of the stiffened collar-beam roofs that have been previously illustrated would be more suitable.

HENRY ADAMS.

Our Insurance Schemes.

CARNARVON.—X. writes: "Please let me know whether your insurance scheme holds good in the case of a weekly subscriber, provided he can prove that he purchases your journal regularly. The reason why I ask is that Smith's agent here finds it more convenient to get weekly payments for all newspapers and weekly papers supplied, and lately (since the change of agency) I have paid for my copies of your journal in one cash payment weekly for all papers supplied to me."

So long as you place an order with your newsagent for this journal to be supplied to you regularly throughout the year, it matters not to us, so far as the insurance schemes are concerned, in what way you pay your newsagent for the copies. So long as you are a regular subscriber you are entitled to the advantages of our insurance schemes.

Correspondence.

Professional Assessors.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—A certain section of the younger members of our profession have been and always are clamouring for the appointment of professional assessors.

The question now arises is this, Has the general result of appointing such assessors been of service to the younger, or, worse still, to the unknown, members of the profession, men who probably act as "ghosts" to the so-called eminent architects, the majority of whom are simply commercial men without an atom of artistic taste or ability either to design or to illustrate the buildings they are entrusted to erect?

In my opinion and experience as an artist and a practical architect it has not and never will be of any use to the gifted practitioners if assessors are chosen only from a small circle of men who are either "members of council," vice-presidents of the Institute, or others who are very intimate with well-known members of the Institute.

It has been stated at the Institute that an architect who is not "well known" cannot be clever, and I suppose therefore that Institute assessors act upon this theory, for there is hardly any important competition in which a professional Institute assessor is engaged but results in the recommendation that some well-known or so-called "eminent" architect be employed.

Even we poor Associates, of any experience at all, are well acquainted with the "styles" of various "well-known architects." We know them as well as we know our own handwriting; how one eminent firm harks back to classic temples, while another so-called "well-known architect" bases his designs upon the example of a range of stabling or an old barn with a "Georgian" (save the mark!) pediment in the centre.

How much better acquainted with the styles of well-known architects therefore must the professional assessors be, when they are probably meeting well-known men (who are often competitors) almost daily!

Indeed, in some competitions where certain Institute men are appointed assessors the result is almost a foregone conclusion.

In a recent competition for a public library (which I was not interested in) a well-known member of council of the R.I.B.A. who was appointed by the president as assessor gave the first premium to a personal friend whose designs and elevations, if not the plans as well, were made I believe by the same draughtsman—"a poor ghost" who designed and drew the elevations for some almshouses built by the assessor; indeed, the elevations of both library and almshouses were almost identical.

The only way to give some satisfaction to clever but still unknown or poor men is either to appoint—in competitions—a retired architect as assessor or else to have a small jury—say three members, one only of whom should be an architect, and he not nominated by the president of the Institute, who, as president, of course always nominates as assessor a member of council—the only professional men apparently that he knows.

It is unfortunate that the law of libel prevents many evils being publicly exposed, but in the course of my long experience in the profession I have come across many "Pecksniffs," and these men, thanks to the "free trade" system in architecture, can call themselves "architects," even in some cases "F.R.I.B.A.s."

From the results which we hope the Architects' Registration Bill will achieve, the next generation will not know such charlatans and such frauds.—Your truly,

HORACE T. BONNER, A.R.I.B.A.

LONDON, E.C.

LIBRARY
OF THE
UNIVERSITY OF ILLINOIS

Supplement to
THE BUILDERS' JOURNAL AND ARCHITECTURAL ENGINEER,
Wednesday, June 20th, 1906

DODDINGS·FARM·BERE·REGIS·DORSET WA FORSYTH·HPG·MAVLE ARCHITECTS

J.K. GROUND.

Change of Address.—Mr. C. E. Mallows, F.R.I.B.A., has removed to Biddenham, near Bedford.

To Include Everybody.—The Council of the Institute is to consider "the practicability of including all architects practising in the United Kingdom within the scope of the Institute"—a resolution to this effect having been carried at the last business meeting.

Manchester Royal Exchange: New Ventilation Scheme.—The Royal Exchange at Manchester has been very much in need of a better system of ventilation. Last year six firms of ventilating engineers were invited to formulate and tender for schemes, Mr. Albion T. Snell, of London, being appointed consulting and advisory engineer. The scheme selected as the best was that submitted by Mr. James Keith, of James Keith & Blackman

Co., Ltd., and the first portion of this scheme is now being carried out by the firm under the supervision of Mr. Snell and the architects of the Exchange. By the scheme now being installed five 54in. Keith-Blackman electric fans for propulsion and extraction will change from five to six million cubic feet of air per hour, which will mean renewing the air of the Exchange once every ten minutes.

Complete List of Contracts Open.

With a few exceptions, news of Contracts Open are not repeated after they have been published once in these columns, so that readers will find particulars in our previous issues of other contracts that still remain open.

Unless expressly stated to the contrary all deposits required for bills of quantities, &c., are returned on receipt of *bona-fide* tenders. The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair-wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

June 21. Swansea.—*Building a new church* at Port Tennant, Swansea, for the Rev. W. Evans. The plans and specification can be seen and quantities obtained on deposit of £2 2s. at the office of E. M. Bruce Vaughan, F.R.I.B.A., 21, Dumfries Place, Cardiff, to whom tenders must be sent by June 21.

June 21. Leeds.—*Proposed Secondary School*, Whin gate, Armley. Contractors desirous of tendering are requested to send in their names to W. S. Braithwaite, Architect's Department, Education Offices, Leeds. The notification of a desire to tender should be accompanied by a deposit of £1 1s. Tenders, endorsed "Tender for Secondary School, Armley," are to be sent in to James Graham, secretary for Higher Education, Education Offices, Leeds, not later than 10 a.m. on June 21.

June 21. London, E.C.—*New fog signal house, dwelling, &c.*, on Flatholm Island, near Cardiff, for Trinity House, E.C. The plans may be inspected and forms of tender and specifications obtained either at Trinity House between 10 a.m. and 5 p.m., or on application to the Officer-in-charge, Trinity Store, Cardiff. Applicants when receiving a form of tender and specification will be required to deposit one pound (£1), on producing the receipt for which at the offices of Corderoy, Selby & Corderoy, 21, Queen Anne's Gate, London, S.W., they may obtain the Surveyor's quantities in connection with the work. Tenders, sealed and marked outside "Tender for new Fog Signal House, &c., Flatholm," must be addressed to A. Owen, secy., and delivered at Trinity House on or before June 21, and no tender can be entertained that is not made on the forms provided.

June 21. Port Isaac.—*Alterations* to boys' and girls' hat and cloak rooms, at the Council School, according to plan and specification, which may be seen at the Council Schools, Port Isaac, or at the office of B. C. Andrew, architect to the committee, Biddick's Court, St. Austell. Forms upon which all tenders must be made may be had from the architect or the secretary. Sealed endorsed tenders to be sent to F. R. Pascoe, secy., Education Office, Truro, on or before June 21.

June 21. Whitecross.—*Erecting a new shelter* at Whitecross Council School according to the plan and specification which may be seen at the Council Schools, Whitecross, or at the office of B. C. Andrew, architect to the committee, Biddick's Court, St. Austell. Forms upon which all tenders must be made may be had from the architect or the secretary. Sealed endorsed tenders are to be sent to F. R. Pascoe, secretary, Education Office, Truro, on or before June 24.

June 21. Barry.—*Building a new church* at Barry for the Rev. H. H. Stewart. The plans and specification can be seen and quantities obtained at the office of E. M. Bruce Vaughan, F.R.I.B.A., 21, Dumfries Place, Cardiff. A deposit of £2 2s. must be made. The tenders are to be sent to the architect not later than June 21.

June 21. Darlington.—*Erection of a manual instruction school* at Corporation Road: also for large additions and alterations to the Gurney Pease Schools, Albert Hill. Plans and specification may be seen and bill of quantities and form of tender obtained at the offices of George Winter, borough surveyor and waterworks engineer, Town Hall, on depositing a cheque for £2 2s. Tenders, endorsed "Schools," must be sent to H. G. Stevenson, town clerk, Darlington, not later than noon on June 21.

June 21. Caerphilly.—*Erection of forty cottages* at Caerphilly, for the Castle Building Club. Plans and specification can be seen at the offices of A. O. Evans Williams & Evans, architects, Pontypridd, to whom tenders are to be sent by June 21.

June 21. Shipley.—*Erection of a vicarage house* for the parish of St. Paul, Shipley. Plans may be seen and bills of quantities obtained at the offices of S. H. & F. Healey, architects, 42, Tyrril Street, Bradford, up to June 21, on which date the tenders are to be sent in.

June 21. Trearlaw.—*Alteration and conversion* of the old Trearlaw Schools into a school for girls and infants. Plans and specification may be seen and bills of quantities obtained at the office of the architect, Jacob Rees, Hillside Cottage, Pentre, on the deposit of £2 2s., which will be returned on receipt of a *bona-fide* tender. Tenders must be made out upon the form of the Council, a copy of which may be had from the Architect at the above address. Sealed tenders, endorsed "Tender for Trearlaw Schools," accompanied by the priced quantities, must reach T. W. Berry, Director of Education, Council Offices, Pentre, Rhondda, on or before June 21.

June 21. Ashburton.—*Alterations and additions* to the Council school. Bills of quantities and forms of tender can be obtained in due course upon payment of £1 1s. Applications must be sent to the Architect, 1, Richmond Road, Exeter, not later than June 21.

June 22. Parkgate (Ireland).—*Erection of stable buildings.* Plans and specification can be seen at the Mansel Parkgate, and at the office of Young & Mackenzie, Scottish Provident Buildings, Belfast. Sealed tenders, addressed to the Rev. W. J. McKinnier, A.M., to be lodged with the Architects on or before June 22.

June 22. Yelverton.—*Erection of new Bible Christian chapel* at Yelverton, Devon. Plans and specification may be seen with W. W. Hooper, Heatherleigh, Yelverton, and at the offices of the architect, W. Beddoe Rees, 3, Dumfries Place, Cardiff, from whom bills of quantities may be obtained. Tenders to be sent to Mr. Hooper on or before June 22.

June 22. Aberdeen.—*For the following works:*—Mason and carpenter works for alterations on the bothy, &c., at Milton of Arbutnott (Eddie) Fordoun; carpenter and slater works of covered court, &c., at Kirkton Farm (Webster), Arbutnott, Fordoun; mason, carpenter and slater works of alterations on house occupied by Mr. Peter Davidson at Blindburn, Turnerhall, Ellon; carpenter repairs on the dwelling-house and steading at Mid Bog (Beattie), Fouldland, Insh; drainage works at the carpenter's croft (Walker), Blindburn, Turnerhall, Ellon. Plans, specifications and general conditions can be seen with the tenants, or with Davidson & Garden, 12, Dae Street, Aberdeen, with whom offers are to be lodged on or before June 22.

June 22. Salisbury.—*Alterations* to the operation ward at the Infirmary, the plans and specifications of which can be seen at the offices of the architects, John Harding & Son, 58, High Street, Salisbury. Tenders to be delivered to S. Buchanan Smith, secy., Crown Chambers, Salisbury, before 4 p.m. on June 22.

June 22. Holywell.—*Alterations and extensions* to the County Intermediate School, Holywell, in the county of Flint. Plans and specifications may be seen at the offices of the architect, Samuel Evans, North and South Wales Bank Buildings, High Street, Mold, from whom bills of quantities may be obtained on payment of a sum of £2 2s. Tenders to be made out on forms to be supplied and sent in to F. Llewellyn-Jones, solicitor, clerk to the Holywell County School Governors, Town Hall, Holywell, North Wales, on or before June 22, in sealed envelopes, marked "Tenders for Extensions at Holywell County School."

June 23. Gillingham.—*Erection of a new school* at Hempstead, Gillingham, to accommodate seventy-six children. Drawings, specification and conditions of contract may be seen on application to Charles H. Langley, 66, Gillingham Road, Gillingham. Bills of quantities and form of tender may be had on payment of £1 1s. The time to be allowed for erecting the building is four months. Tenders, duly endorsed, must be delivered to E. T. Atchison, secy., 8, Waterloo Road, Gillingham, Kent, before noon on June 23.

June 23. Shrewsbury.—*Erection of wooden buildings, stages, &c.*, for the Shropshire Horticultural Society's annual show in August. Plans and specification will be supplied on application to Walter Richards, Swan Hill, Shrewsbury, on payment of £1 1s. The work will be divided as follows:—(1) Buildings and hoardings; (2) horse track, stages and fittings; (3) draining; (4) plumbing. Tenders will be received for any or all sections, and must be sent in by June 23 next, addressed "Chairman of Committee," endorsed "Tender for Erections," to the care of Adnitt & Naunton, hon. secs., The Square, Shrewsbury.

June 23. Birkenhead.—*Erection and completion of a post-mortem room*, Livingstone Street. Plans, specification and particulars can be seen and bills of quantities and form of tender obtained on application at the office of Charles Brownridge, M.I.C.E., borough engineer and surveyor, upon a deposit of the sum of £1 1s. Fair wages clause. Tenders, upon the printed form supplied, sealed and endorsed "Tender for Post-mortem Room," to be sent in to Alfred Gill, town clerk, Town Hall, Birkenhead, not later than noon on June 23.

June 23. Good Easter.—*Pair of labourers' cottages* at Good Easter, Essex. Plans and specification can be seen at the office of Frank Whitmore, architect and surveyor, 73, Duke Street, Chelmsford, to whom tenders are to be sent not later than 10 a.m. on June 23, endorsed "Tender for Cottages at Good Easter."

June 25. Ardsby.—*Conversion* of late boardroom into teachers' sitting-room at West Ardsley, Westerton

Schoolhouse. For carrying-out alterations to drainage, &c., at West Ardsley Hill Top School. A plan of the alterations at Hill Top School may be seen, and copies of specifications for both contracts obtained from the Education Offices, Northgate, Wakefield. Separate tenders must be submitted for each school. Sealed tenders, duly endorsed, must be sent to Alexander Angus, Education Offices, Northgate, Wakefield, not later than 10 a.m. on June 25.

June 25. Barnsley.—*Erection of three elementary schools*, to accommodate 360, 300 and 360 scholars respectively, on a site in Racecommon Road, Barnsley. Applications, together with a deposit of £2 2s., to be made to the architect, Ernest W. Dyson, 14, Market Hill, Barnsley, not later than June 25. Fair wages clause.

June 25. Sevenoaks.—*Erection of an isolation hospital* at Otford, Sevenoaks, Kent, for the R.D.C. The drawings, specifications, and conditions of contract, prepared by the architect, M. Maberly Smith, can be seen at the offices of Cleed & Belcher, of 8 and 9, Martin's Lane, Cannon Street, E.C., to whom intending competitors are requested to send in their names before June 15, and from whom bills of quantities, together with forms of tender, can be obtained on and after June 20, on payment of £2. Tenders are to be delivered before noon on June 25, at the office of George F. Carnell, clerk, 130, High Street, Sevenoaks.

June 25. Tylorstown.—*Extending and converting premises* in Tylorstown into two shops for A. I. Loble, East Road. Plans and specification can be seen at the office of A. O. Evans, Williams & Evans, architects, Pontypridd. Sealed endorsed tenders to be sent to Mr. Loble on or before June 25.

June 25. High Usworth.—*Extensions* to the Wesleyan chapel, and for decoration of the interior. Plans and specifications can be seen at the office of the architect, J. Walton Taylor, F.R.I.B.A., St. John Street, Newcastle. Sealed tenders, properly endorsed, are to be delivered to Rev. Theodore Bishop, 11, Regent Terrace, Gateshead, not later than 10 a.m. on June 25.

June 25. Llanbradach.—*Erection of thirty-one houses* at Llanbradach, for the Llanbradach Building Club. Plans and specification can be seen at the office of John H. Phillips, F.R.I.B.A., architect, Clive Chambers, Windsor Place, Cardiff, to whom sealed tenders are to be delivered by June 25.

June 26. Stanleytown.—*Erection of three houses and vestry* at Stanleytown, Rhondda Valley, for the Trustees of the Welsh Calvinistic Methodist Chapel, Pontygaith. Plans and specification may be seen with William Williams, grocer, Cash Stores, Pontygaith, to whom sealed and endorsed tenders are to be delivered before 5 p.m. on June 26.

June 26. Wrexham.—*Erection of a new post-office* at Wrexham. Drawings, specification, and a copy of the conditions and form of contract may be seen on application to the postmaster between 10 a.m. and 5 p.m. Bills of quantities and forms of tender may be obtained at the Office of Works, on payment of £1 1s. Tenders must be delivered before noon on June 26, addressed to the Secretary, H.M. Office of Works, &c., Storey's Gate, London, S.W., and endorsed "Tender for New Post Office, Wrexham."

June 26. Gordontown.—*For the mason, carpenter and slater works of additions* to steading, Gordontown, Auchterless; also for the carpenter and slater work of addition to steading and offices, Bogamma, Auchterless. Plans and specifications may be seen with the respective tenants, and with James Duncan & Son, architects, Turfrit, and attendance will be given at Gordontown on June 23, at 12 o'clock noon, to show the work to intending contractors. Sealed tenders to be lodged with Thomas Fotheringham, Gordon's College, Aberdeen, factor on the estates, or the architects, on or before June 26.

June 26. New Shoreham.—*Repairs* to lych gate at cemetery, painting lamps, &c., and exterior of town hall, for the U.D.C., particulars of which can be obtained of A. W. Nye, town surveyor, Town Hall, Shoreham. Tenders to be delivered to Harold Brown, clerk to the Council, Church Street, New Shoreham, not later than noon on June 26, endorsed "Tender for Lych Gate Repairs."

June 27. Stoke-under-Ham.—*Erection of five cottages* at Stoke-under-Ham. Plans and specification can be seen at W. Terrell's, North Street, Stoke-under-Ham, to whom sealed tenders must be delivered not later than 6 p.m. on June 27.

(Continued on p. 336.)

VILLAS AT HARROGATE.

THE following are some particulars of the semi-detached villas in Springfield Avenue, Harrogate, illustrated on p. 318 of our issue for last week, which particulars were received too late for insertion with the illustration:—The houses have been erected for Mr. R. S. Palliser on a site sloping to the rear to a wooded dell, and with high sloping banks opposite. To economize in the otherwise wasted and unnecessary height in the basement each floor at the back is 2ft. lower than the front portion. Immediately on entering the hall a vista is obtained through the vestibule screen door and conservatory into the dell, which has been a controlling feature of the plan. A balcony to the morning-room, with way down to garden by outside staircase from conservatory, is also designed to make the most of the views at the back. The houses have four reception-rooms, (billiard-room on second floor, partly in the roof), eight bedrooms, the usual conveniences, and separate servants' bathroom and lavatory. The basement is roomy and, owing to the quick slope, about 11ft. high. The elevations are carried out in Borobridge sand stock bricks and Scotten stone, both of local origin, with the upper portion of the walls rough-cast, coloured a light cream, the roof being covered with Lawrence's Bracknell hand-made sand-faced tiles. The dining-room has oak panelling and fitted inglenook fireplace, with polished Hopton Wood stone jambs, "Well Fire" grate and Ruskin pottery tiles. The ceiling is panelled with oak beams and ceiling moulds. The hall and staircase have wood fittings and panelings, and are finished in white and green enamel. Radiators, from a small boiler in basement, are provided on each floor. Mr. Arthur A. Gibson, of 5, Prospect Crescent, Harrogate, is the architect.

Electrical Notes.

Electricity at the King's Sanatorium.

The installation for electric lighting and supply at the King Edward VII. Sanatorium near Midhurst presents an object-lesson in good work. In the engine-room there are three combined sets, each comprising a Willans & Robinson compound high-speed engine capable of developing 48-b.h.p. at 150 lbs. pressure, and a speed of 470 revs., coupled to a compound-wound dynamo by Messrs. Newtons, Ltd., of Taunton, giving 250 volts and 100 ampères, for light and power. Two of these sets are sufficient to supply the maximum demand. The current is taken to a white marble main switchboard, and thence through two feeders supplying a ring main carried through the subways and along the basement corridors, branches being taken from them to supply groups of rooms. The casing has a smooth, rounded outline without corners to prevent any accumulation of dust and dirt. The wires can thus easily be inspected in case of damage, and as the casing is painted to match the decoration of the walls it is scarcely noticeable. There is a complete installation of electric bells, so that each patient can communicate from his own room to the nurse in charge, and in case a patient is confined to his bed he is provided with a telephone attachment to the bell so that he may speak direct to the nurse from his own room. Messrs. Foote & Milne, Ltd., of Westminster, were the contractors for the electric lighting, telephones, &c., while Messrs. Waygood & Co., Ltd., have supplied and erected an electric press-button passenger lift of special design, consisting merely of a platform with sides and back; it has no roof, being supported by cables at the sides. This lift will take 12 cwts.

and has a speed of 100 ft. per minute. Mr. E. R. Dolby, M.I.C.E., was the consulting engineer for the work.

Electric Power on the G.W.R.

Under this head in the current number of "Engineering" some interesting particulars are given of the fitting-up for electric traction of the suburban tracks of the Great Western Railway, *i.e.*, on the northern half of the Inner Circle. This work has been carried out to the plans of Messrs. Kennedy & Jenkin, consulting engineers to the company. A generating station has been erected at Park Royal equipped with 750 kilowatt three-phase generators, built by the Electric Construction Co., Ltd., each driven direct by Bellis & Morcom triple-expansion engines running at 250 revs. per minute. There are also two exciters. High-tension three-phase current is transmitted to the sub-stations at 6,600 volts and 50 cycles per second by six three-cover paper-insulated lead-covered and armoured cables laid underground on the solid system. There are three sub-stations, namely, at Old Oak Common, Royal Oak and Shepherd's Bush. At these most of the current is transformed to 630 volts, which is the pressure adopted on the third rail. The electrical equipment is by the British Thomson-Houston Co. Each car will have four 150-h.p. motors, and will give a speed of 16 miles an hour, inclusive of stops, with a maximum speed of 30 miles an hour.

A.A. Studio.—The final meeting of the studio of the Architectural Association was held on Monday evening, when Prof. Beresford Pite addressed the students. There was a show of work done during the past session. The A.A. Council have decided to close the studio as, in view of the assured success of the day school, they cannot hope the studio will be self-sustaining.

BLOCK PLAN

VIEW FROM SW

NEW CHURCH FOUR OAKS

This design for a small new church to be erected at Four Oaks, Sutton Coldfield, Warwickshire, was submitted recently in a limited competition, when Mr. W. H. Bidlake acted as assessor. Accommodation for 252 chairs is provided in the nave, and 40 stalls for a choir of twenty under the tower, the vestries being arranged to the east of the chancel and connected therewith by a corridor on the south side. An external pulpit was suggested in addition to the one inside, and the organ to be placed upon a screen instead of in a chamber. A red sandstone was proposed to be used for the wall facing, windows, &c., and Colleyweston stone slates for the roofs. The architects are Messrs. Bateman & Bateman, of 81, Edmund Street, Birmingham.

CONTRACT LIST (continued from p. 334).

June 25. Edinburgh.—Alterations in connection with the forming of isolation rooms in male and female dormitories, Craigleith Poorhouse. The plans can be seen and schedules of quantities obtained on application to R. M. Cameron, architect to the Parish Council, 53, Great King Street, Edinburgh. Sealed tenders are requested to be addressed, delivered, and endorsed to the Clerk, Parish Council Offices, Castle Terrace, Edinburgh, not later than 10 a.m., on June 25.

June 26. Ulverston.—Erection of a house at Newby Bridge, near Ulverston, for Miss Bannister. The drawings and specifications may be seen and copies of the quantities obtained from the architect's offices, Settle & Brundritt, A.R.I.B.A., Ulverston and Barrow-in-Furness, to whom tenders are to be delivered not later than noon on June 26, endorsed "Tenders Newby Bridge House."

June 26. Aberbargoed.—Erection of thirty houses at Aberbargoed, for the Ty-Fry Building Club. Plans, specification and form of contract can be seen and form of tender obtained at the office of D. J. Thomas, architect, High Street, Blackwood, Mon., or at the Ivy Bush Hotel, Pengam, Mon. Sealed and endorsed tenders are to be addressed to the chairman of the Club, T. B. Vendoll, and delivered at the Ivy Bush Hotel, Pengam, not later than noon on June 26.

June 27. Manchester.—Alterations to Litchford and Cooper Fold Farm Buildings, on the Blackley Estate. Drawings may be seen and specification and bill of quantities obtained at the office of the City Architect, Town Hall, upon payment of £1 rs. Sealed tenders, enclosed in the official envelope, to be delivered at the City Architect's not later than 9 a.m. on June 27.

June 27. Inverurie.—For the mason, carpenter and slater work for the undernosed:—Dairy at Brownhills (Mrs. Singers); additions to Muttonbrae Steading; and poultry-house and pig-house at Birns. William Stewart, builder, Inverurie, will meet intending offerors on June 23 at the respective places—Brownhills at 11 a.m.; Birns at 12 o'clock noon; and Muttonbrae at 1 o'clock afternoon—to point out the work and afford any other information required. Plans and specification may be seen either at the places or in the hands of W. Stewart, Inverurie. Offers for the works will be received by Alex. Stronach, junr., & Son, advocates, 20, Belmont Street, up to June 7.

June 27. Ramsgate.—Supply of Portland cement for twelve months. The contractor may estimate that the quantity required will not be less than 100 tons, and probably not more than 150 tons. Specification, form of tender and full particulars may be obtained on application to the Borough Engineer, Albion House, Ramsgate, between 10 a.m. and 4 p.m. Sealed tenders, endorsed "Tender for Cement," are to be addressed to the "Chairman of the Works Committee," and delivered under cover to the Borough Engineer, Albion House, Ramsgate, on or before noon on June 27.

June 28. London, S.W.—Registry of shipping and seamen—adaptation. Drawings, specification and a copy of the conditions and form of contract may be seen on application to J. B. Westcott, M.V.O., H.M. Office of Works. Bills of quantities and forms of tender may be obtained at the same address on payment of £1 rs. Tenders must be delivered before noon on June 28 addressed to the Secretary, H.M. Office of Works, &c., Storey's Gate, London, S.W., and endorsed "Tender for Registry of Shipping and Seamen—Adaptation."

June 29. Eston Junction.—Alterations. Contractors desirous of submitting an estimate for the several works in connection with the proposed alterations and additions to the above-named school may obtain forms of tender and inspect the plans at the school between the hours of 9 a.m. and 4 p.m. Tenders, sealed and endorsed "Tender for Alterations, Eston Junction School," to be delivered to Douglas Smith, secy., County Hall, Northampton, not later than June 29.

June 30. Preston.—Erection of a secondary school for girls in Moor Park Avenue, Preston. Plans and specifications may be seen and blank bills of quantities and form of tender obtained at the Education Offices, Lancaster Road, Preston, on payment of £2 2s. Sealed tenders, endorsed "Tender for Secondary School," must be delivered not later than noon on June 30 to Henry Hamer, town clerk, Town Hall, Preston.

June 30. Glenleam (Ireland).—Construction of an extension to the existing Board pier at Glenleam, Valencia Island. Plans and specification can be inspected at the office of R. Fitzgerald, 25, Denny Street, Tralee, between 10 a.m. and 5 p.m., by whom tenders will be received up to June 30.

June 30. Derby.—Erecting a shed for carts at the Workhouse. Plans and specifications can be seen and bill of quantities obtained on application to F. C. Coulthurst, architect and surveyor, 4, Albert Street, Derby. Sealed tenders, endorsed "Cart Shed" to be delivered to N. Twigg, clerk to the Guardians, Poor Law Offices, Derby, on or before June 30.

June 30. Rhosymedre.—Alterations and improvements to the Congregational Chapel, Rhosymedre, Ruabon. The plans and specification can be seen by appointment with Arthur Davies, 61, Chapel Street, Rhosymedre, to whom the tenders are to be delivered (sealed and endorsed) not later than June 30.

July 2. Plymouth.—Erection of Infirmary buildings at the Plymouth Workhouse, for the Guardians. Builders desirous of tendering are requested to forward their names and addresses to the architects, Thornely & Rooke, 11, The Crescent, Plymouth, on or before July 2.

July 2. Caistor.—Altering the present Primitive Methodist Chapel, schoolroom, and erecting a new building in connection therewith. Specifications and plans may be seen at T. Mairs, Gas Works, Caistor. Tenders are required to be in by July 2.

July 3. Leeds.—Erection of new workshops, cement warehouse, &c., at the Higwains Depot, 155, Kirkstall Road. Drawings may be seen, and instructions to persons tendering, conditions of contract, specification, bills of quantities, form of tender, and form of agreement obtained on application at the depot, and on depositing £3 3s. 10d. for a full set of quantities, or £1 rs. for the quantities for each separate trade. Sealed tenders, endorsed "Tender for

New Workshops, Cement Warehouse, &c.," and addressed to Robert E. Fox, town clerk, must be delivered at the Town Clerk's Office, Town Hall, Leeds, not later than 10 a.m. on July 3.

July 3. Cardiff.—Erection of new offices, stores, stables, &c., at Newtown Goods Yard, Cardiff, for the Great Western Railway. Plans and specification may be seen, and forms of tender and bills of quantities obtained at the office of the Engineer at Newport Station, between 10 and 4. Tenders addressed to G. K. Mills, secy., Paddington Station, London, and marked outside "Tender for Works at Cardiff," will be received on or before July 3.

July 4. London, W.—Erection of receiving wards and porter's lodge at the Workhouse, in the Woodfield Road, W., for the Guardians of Paddington, pursuant to plans and specification to be seen at the offices of the architect, F. J. Smith, F.R.I.B.A., Parliament Mansions, Victoria Street, S.W., between 10 and 5, where all necessary information can be obtained, and also form of tender, upon which alone proposals will be received. Bills of quantities may also be obtained at the offices of the Architect on payment of a deposit of £5 5s. Fair wages clause. Sealed tenders must be delivered at the offices of the Guardians, 313-319, Harrow Road, W., before 10 a.m. on July 4.

July 5. Gosport.—Erection of a new school in Clarence Square, Gosport, to accommodate 330 boys. Plans and specifications may be seen at the offices of the architect, H. Frost, surveyor to the District Council, Gosport, and quantities and forms of tender obtained on payment of a deposit of £5. Sealed tenders, endorsed "Clarence Square School," should be delivered to George R. Walker, secy., Education Offices, High Street, Gosport, not later than noon on July 5.

July 5. St. Keverne.—Erection and completion of proposed residence at St. Keverne, for Dr. E. Levertin-Spry, according to plans and specification, which may be seen by appointment at the proprietor's residence or at the office of Sampson Hill, architect, Green Lane, Redruth, from whom all particulars relating to the work may be obtained. Sealed endorsed tenders are to be sent to the proprietor, St. Kevern, R.S.O., on or before July 5.

July 7. Eastwood.—Erection of a new school at Eastwood, near Southend-on-Sea, to accommodate 160 children, and also for certain alterations and additions to the existing school. Contractors desirous of tendering are required to communicate with S. I. Adams, M.R.S.I., architect and surveyor, Weston Chambers, Weston Road, Southend-on-Sea, not later than noon on June 27, enclosing cheque for £2 2s. Plans and specification may be seen at the offices of the Architect between 10 a.m. and 4 p.m. (Saturdays 10 a.m. to 12 noon) after June 30. Tender, sealed and endorsed "Tender for Eastwood School," are to be sent to J. F. Ingram, secy., Bank Chambers, Weston Road, Southend-on-Sea, by 10 a.m. on July 7.

July 9. Newark.—Alterations and additions at the Union Infirmary, Bowbridge Road, Newark, for the Guardians. Persons desirous of tendering for the alterations and additions thereto are requested to forward their names and addresses and a cheque for £2 2s. as a deposit to A. J. Franks, clerk to the Board, Union Offices, Newark, on receipt of which form of tender and bills of quantities will be forwarded. Plans and specifications may be inspected at the office of the architect, Arthur Marshall, A.R.I.B.A., King Street, Nottingham. The deposit will be returned upon receipt of a bona fide tender upon the form to be supplied. Sealed tenders endorsed "Alterations at Infirmary," must be sent in to the Clerk not later than July 9.

No date. York.—Erection of a new factory about 250ft. by 60ft., together with a corridor and bridge, for Rowntree & Co., Ltd., "The Cocoa Works," York. The foundations, floors, stanchions and staircases to be in reinforced concrete. Plans can be seen and specifications, quantities and form of tender obtained at the Architect's Office, The Cocoa Works, York, on payment of £5 5s.

No date. Magherahamlet (Ireland).—Building a teacher's residence at Magherahamlet, Ballynahinch. Plans and specifications can be seen and full particulars given by Rev. W. Carse, Magherahamlet.

No date. Portadown (Ireland).—Building shop and showrooms, for G. R. Forbes & Co., drapers, Portadown. Plans and specifications to be had from architect, J. W. Walby, Edward Street, Portadown, and 56, Dublin Road, Belfast.

No date. Newport.—Works for W. Hancock & Co. (Ltd.), brewers and wine merchants, Newport and Cardiff:—(1) Pulling down and rebuilding the "Foresters' Arms," at Risca; (2) pulling down and rebuilding the "Rifleman's Arms," at Risca; (3) alterations and repairs to the "Prince of Wales Inn," at Pontypool; (4) alterations and repairs to the "Three Salmons Inn," at Pontypool; (5) repairs to "Green Dragon Hotel," at Chepstow. Plans and specifications may be seen and bills of quantities obtained at the offices of Swallow & Havard, architects and surveyors, Steam Packet Chambers, Dock Street, Newport, Mon.

ENGINEERING.

June 25. Ossett.—Erection of standpipe, 30ft. high, 6in. pipes and meter, at their Service Reservoir, Childswell Lane, Ossett. Tenders, marked "Standpipe," to be sent to the Town Clerk's Office, No. 1, New Street, Ossett, on or before June 25. For particulars apply to E. Illingworth, water inspector, Ossett.

June 25. Edinburgh.—Supply of lead-covered, paper-insulated copper cables for electricity supply conductors for the year ending May 15, 1907. The specification and form of tender can be obtained from the Engineer on payment of a deposit of £2 2s. Tenders must be sent to the Town Clerk, City Chambers, Edinburgh, on or before June 25, and must be endorsed "Tenders for the Supply of Electricity Cables."

June 26. London, S.W.—Reconstruction of the bridges known as Lee Bridge and Lee Green Bridge, carrying Lee High Road over the River Quaggy, both

situate in the metropolitan borough of Lewisham. Persons desiring to submit tenders may obtain the drawings, specifications, bills of quantities, form of tender and other particulars upon application to the chief engineer, Maurice Fitz-Maurice, C.M.G., at the County Hall, Spring Gardens, S.W., upon payment to the cashier of the Council of the sum of £3. Full particulars may be obtained on application at the County Hall previously to the payment of the fee for the specification, &c. Tenders must be upon the official forms, and the printed instructions contained therein must be strictly complied with. Fair wages clause. Each tender is to be delivered at the County Hall, in a sealed cover, addressed to the Clerk of the London County Council, Spring Gardens, S.W., and marked "Tender for the Reconstruction of Lee and Lee Green Bridges." No tender will be received after 10 a.m. on June 26.

June 26. London, S.W.—Supply of the following stores for the Southern Mahratta Railway Co., Ltd.:—8,800 safety chains, 9,736 spiral and volute springs, 20 tons copper ingots, and 6 locomotive boilers, as per specifications and drawings, which may be seen at the offices of the Company. The charge for each specification is £1 rs., which will not be returned. Tenders must be sent in addressed to E. Z. Thornton, secy., 46, Queen Anne's Gate, S.W., marked "Tender for Safety Chains," or as the case may be, not later than noon on June 26.

June 27. Portsmouth.—Supply, delivery and erection of water softening plant, water storage tank, steam, feet and exhaust piping, and sundry iron-work. Specification and form of tender can be obtained at the Town Hall, Portsmouth, on payment of a fee of £2 2s. A copy of the specification may also be inspected (but not obtained) at the offices of the Consulting Engineers, Kincaid, Waller, Manville & Dawson, 23, Great George Street, Westminster, S.W. Tenders must be for the whole of the above work, and no tender for a portion only will be considered. Fair wages clause. Sealed tenders, endorsed "Tender for Contract No. 21," must be forwarded to Alexander Hellard, town clerk, Town Hall, Portsmouth, on or before noon on June 27.

June 27. Birmingham.—Reconstruction of Banbury Street sewer across Paddy's Bank, including a length of about 270 yds. of 3 ft. 6 in. brick barrel sewer in tunnel, and crossing under the Birmingham canal in 42in. cast-iron pipes, including manholes, river outlet, and other incidental works. The plans and specification may be seen, and quantities and forms of tender obtained on deposit of a sum of £2. Fair wages clause. Tenders sealed and endorsed "Banbury Street Sewer," and addressed to the Chairman of the Public Works Committee, must be delivered at the offices of T. Arnall, acting City surveyor, the Council House, Birmingham, on June 27.

June 27. Erdington.—Electrical equipment on the Overhead Trolley System of Tramway No. 1 in the District (2 miles 2 furlongs 930 chains route length) including poles and overhead line equipment for the U.D.C. Contractors desiring to submit tenders for the work should forward their names and addresses to one or other of the joint engineers, Robert Green, of 37, Waterloo Street, Birmingham, and H. H. Humphries, engineer to the Council, Council House, The Park, Erdington, together with a deposit of £5 5s. Drawings may be examined and copies of specification, bills of quantities, and forms of tender obtained upon application to either of the engineers. Sealed tenders, endorsed "Tramways Equipment," are to be delivered to Herbert H. Humphries, engineer to the Council, Council House, Erdington, Birmingham, before noon on June 27, with bills of quantities, which must have every item legibly priced in ink and with the columns added up to the exact total amount of the tender. Fair wages clause.

July 2. Epsom.—Water supply, for the R.D.C. Supplying about 814 yds. of 3in. cast-iron water-pipes and the excavation of trenches, toe carting and laying of the pipes and the fixing of hydrants, &c. Specification of the works can be seen by appointment at the office of F. A. Pratley, the surveyor to the Council, Waterloo Road, Epsom, where full information can be obtained. Tenders, upon prescribed forms (to be obtained on application), must be delivered at the office of the Clerk, addressed "To the Chairman of the Epsom Rural District Council, Lonsdale, Epsom."

July 2. Aylesbury.—Pulling down the existing two old brick bridges and the construction of two new steel girder bridges (over the Grand Junction Canal and mill stream), retaining walls and the kerbing, channelling, metalling, &c., of the roadway between the two bridges, for the U.D.C. The drawings may be seen and copies of the bill of quantities, specification and form of tender obtained on application to W. H. Taylor, engineer and surveyor to the Council, Town Hall, Aylesbury, on payment of £3 3s. Sealed tenders, which must be on the form supplied, should be endorsed "Park Street Bridges," and addressed to Percy A. Wright, clerk to the Council, Town Hall, Aylesbury, to be sent in not later than 4 p.m. on July 2.

July 2. Yiewsley.—Demolishing the old bridge (to foundation level) crossing the Grand Junction Canal at Yiewsley, West Drayton, Middlesex, and for erecting a new structure of 40ft. span in brick, stone and steel in its place, in accordance with plans and specification, which may be seen at the office of H. T. Wakelam, county engineer, Middlesex Guildhall, Westminster, during office hours. Bills of quantities, with forms of tender, may also be obtained on payment of £5. Tenders, endorsed "Colham Bridge, Yiewsley," must be delivered in sealed envelopes to Sir Richard Nicholson, Middlesex, Guildhall Westminster, S.W., on or before July 2.

July 2. Belfast.—Extension of the motor car shed at the Belfast terminus of the Great Northern Railway Co. (Ireland). Parties wishing to tender may see the drawing and specification at the office of W. H. Mills, engineer-in-chief, Amiens Street, Dublin, or copies of them at the office of the District Engineer, Belfast, and can obtain at the said offices lithographed copies of the drawing, specification and form of tender on payment of 10s. (not returnable) per set. Tenders, made out on the forms supplied by the Company and endorsed "Tender for Motor Car Shed," should be delivered to T. Morrison,

secty., Secretary's Office, Amiens Street Terminus, Dublin, not later than 10 a.m. on July 2.

July 2. Dublin.—Construction of about 14 miles of pipe sewers, ejector stations, rising mains, air transmission mains, air-compressing station, together with the supply and erection of various machinery and auxiliary works connected therewith, chiefly in the East Clontarf and West Clontarf Wards of the City of Dublin. The drawings, specification, bills of quantities and forms of tender may be inspected at the office of the City Engineer, City Hall, Dublin, and at the office of the consulting engineer, Mr. George Chaterton, M.I.C.E., 6, The Sanctuary, Westminster, between 10 a.m. and 5 p.m. daily, Saturdays excepted, and a limited number of copies of the said documents may be obtained at the offices aforesaid on payment of the sum of £5 5s. (Crossed cheques only will be received in payment.) No copies of the documents will be sent to contractors until they have been inspected by a representative of the firm. Sealed tenders, and endorsed on the envelope "Tenders for Clontarf Sewerage," must be addressed to the Chairman of the Improvements Committee, City Hall, Dublin, and delivered before noon on June 2. With each tender must be submitted the names of two sureties who will be prepared to execute a joint and several bond for the due performance of the contract in a sum of £10,000. No tender shall be withdrawn or amended (except with the consent of the Corporation) before the expiration of a period of two months of delivery to the Corporation. The work executed under this contract shall be done entirely by local labour, and where this is considered impracticable, the contractor is to apply to the Municipal Council for permission to have the work done by other than local labour, and the Council having considered the statements submitted by the contractor shall by resolution determine whether the work is to be done by local labour or otherwise, and the contractor is to be bound by such resolution. The workshops, factories and other places used by the contractor in the execution of the contract shall be open to inspection at any time during working hours by a duly authorised representative of the trade affected by such contract upon the production of a permit signed by the town clerk or other officer appointed by the Supplies Committee of the Corporation.

July 4. Buntingford.—Construction of new water-works, including the providing and laying of cast-iron pipes, construction of reservoir and engine-house and the provision of pumping machinery at Buntingford, for the R.D.C. Drawings may be seen and copies of the specification, bill of quantities and form of tender obtained at the office of the engineer, John Chadwick, F.G.S., Bletchley, Bucks, upon payment of a deposit of £3 3s. A duplicate set of drawings may also be seen at the Surveyor's Office, Buntingford. Sealed tenders, on the prescribed forms, endorsed "Tender for Water-works," must be received at the office of J. Chalmers-Hunt, clerk to the Council, the Boardroom, Union Workhouse, Buntingford, Herts, not later than noon on July 4.

July 6. Wallasey.—Extension of refuse destructor (not buildings), for the U.D.C., the specification of which and further particulars may be obtained on application to W. H. Travers, engineer and surveyor, Public Offices, Egremont, Cheshire. A charge of £3 will be made. Tenders, enclosed in sealed envelopes, endorsed "Tender—Refuse Destructor," and addressed to H. W. Cook, clerk and solicitor, Public Offices, Egremont, Cheshire, to be forwarded per post not later than July 6.

July 7. Teignmouth.—Laying and jointing of about 17,110 lineal yds. of 6 in., about 1,120 lineal yds. of 6 in., and about 5,850 lineal yds. of 4 in. British Mannesman steel pipes, including haulage of pipes from various railway stations (a separate contract having been entered into for the supply of the pipes), together with the erection of a meter-house and the provision of all necessary sluice, air and other valves, washouts, meters, chambers and incidental works, including the crossing of the tidal river Teign, about one-fourth of a mile in width. Plans may be seen and copies of the general conditions, specification, bills of quantities and form of tender obtained on application at the office of C. F. Gettings, engineer, Town Hall, Teignmouth, on payment of a deposit of £5. Sealed tenders, upon the form supplied, addressed to A. Percival Dell, clerk to the Council, Town Hall, Teignmouth, Devon, and endorsed "Teignmouth Water Scheme, Contract No. 2," must be delivered on or before July 7. Fair wages clause.

July 9. New Zealand.—Tunnel. Alternative tenders will be received at the Office of the High Commissioner for New Zealand, Westminster Chambers, 13, Victoria Street, London, S.W., for the construction of a tunnel 5 miles $2\frac{1}{2}$ chains in length at Arthur's Pass, through the dividing range between Canterbury and Westland, on the route of the New Zealand Midland Railway. They are to be addressed to the High Commissioner for New Zealand, 13, Victoria Street, Westminster, S.W., and marked on the outside "Tender for Arthur's Pass Tunnel—60 months" (or "48 months"). Tenders will be received up till noon on July 9. Specifications, conditions, tender forms and other information may be obtained on application to the High Commissioner upon payment of a deposit of £10. Plans can also be inspected at the High Commissioner's Office.

July 10. Wallasey.—Supply and delivery of alternating current transformers required during the next two years, for the U.D.C. Copies of the specification may be obtained on application to the engineer, J. A. Crowther, at his office, Seaview Road, Liscard. A charge of £1 rs. will be made for each copy of the specification. Sealed tenders on the form provided for the purpose, endorsed "Tender for Transformers," to be delivered to H. W. Cook, clerk and solicitor, Public Offices, Egremont, Cheshire, on or before July 10.

August 7. Lancaster.—Reconstructing and improving the steam-heating arrangements and hot-water service of the County Lunatic Asylum. The committee is prepared to consider tenders from engineers or firms

who are willing to make a survey, free of cost to the committee, and to report on what improvement they would propose to make in the present system. Further information, if required, may be obtained on application to the medical superintendent. Tenders will be received up to the morning of August 7.

Aug. 31. Rio de Janeiro.—Supply of 34 metallic superstructures for bridges on the Central Railway. A deposit of 5,000 milreiros is required. For particulars apply to Intendencia da Estrada de Ferro Central do Brazil, Rio de Janeiro. Tenders to be sent in by Aug. 31.

IRON AND STEEL.

June 26. London, W.C.—Supply and delivery of about 950 tons of 42 in. and other cast-iron pipes and castings, for the Metropolitan Water Board. Forms of tender and contract, with specification, may be obtained and the drawings inspected upon application to the Engineer, at The Firs, Southern Road, Fortis Green, East Finchley, N., between 10 and 4 (except Saturdays). Tenders, enclosed in sealed envelopes, addressed to "The Clerk of the Board, Metropolitan Water Board, Savoy Court, Strand, W.C.," and endorsed "Tender for Pipes and Castings—Staines Reservoirs Communication Works, Contract No. 25," must be delivered at the Offices of the Board not later than 10 a.m. on June 26.

June 30. Sheffield.—Wrought-iron fencing and gates at the Parish Churchyard, Sheffield. Specification and quantities may be obtained at the office of Charles F. Wike, C.E., city surveyor, Town Hall, Sheffield, on payment of 10s., which will be refunded on receipt of a bona-fide tender. Tenders, endorsed "Parish Churchyard Fencing," are to be sent in not later than 9 a.m. on June 30, addressed to "The Chairman and Members of the Improvement Committee, City Surveyor's Office, Town Hall, Sheffield." Fair wages clause.

PAINTING AND PLUMBING.

June 21. Ramsgate.—Painting the Town Hall. Specification can be seen and full particulars obtained on application at the Borough Engineer's Office between 10 a.m. and 4 p.m. Tenders, endorsed "Tender for Town Hall," and addressed to the Chairman of the Watch Committee, are to be delivered at the Borough Engineer's Office, Albion House, Ramsgate, on or before noon on June 21.

June 21. Ramsgate.—Alterations and painting, Italian Gardens, West Cliff. Plans and specifications can be seen and full particulars obtained on application to the Borough Engineer's Office between 10 a.m. and 4 p.m. Tenders, endorsed "Tender for Italian Gardens," and addressed to the Chairman of the Works Committee, are to be delivered at the Borough Engineer's Office, Albion House, Ramsgate, on or before noon on June 21.

Trade and Craft.

The "Vortex" Chimney-pot.

This chimney-pot is yet another of the type which aims at preventing draught. It is provided with spiral air passages to create an upward whirling current, while a cone-shaped narrowing at the top reduces the force of wind on the smoke exit, and at the same time increases the strength of the upward current, so preventing the wind getting down the centre flue and causing draught. The "Vortex" chimney-pot is made in red and buff terracotta, and salt-glazed. It is the patent of Mr. William Monks, of 250, Edmund Road, Sheffield, and is in stock at Messrs. J. Parker & Sons, Silver Street Head and Langsett Road, Sheffield; Messrs. Thomas Wilkinson & Sons, Guernsey Road, Heeley; and Messrs. D. & S. Clarke's, Greaseboro' Road, Rotherham.

Anaglypta and Salamander.

The Anaglypta branch of the Wallpaper Manufacturers, Ltd., have just published a large and sumptuously produced catalogue of their "Anaglypta" and "Salamander" decorations. It contains photographic illustrations and dimensioned diagrams of a very large number of patterns. The extent to which these decorations are now used renders such a catalogue of the greatest value, especially as there are notes included giving instructions for fixing, colouring, protection against damp, &c. "Anaglypta" is made of paper pulp which is deposited liquid on to moulds of considerable thickness; it dries to these shapes and retains them without danger of the relief being damaged in affixing to the wall. "Anaglypta" is also made in boards. "Salamander" decorations are made only in boards from pulped asbestos. Both kinds of boards are embossed afterwards. It follows, therefore, that these cannot be made in such high relief as the "Anaglypta" deposited in moulds. The advantages are that repeating designs can be easily and cheaply made, such as borders, friezes, dados, &c. "Salamander" decoration is of course a valuable fire-resistant. We publish illustrations of some good details taken from the firm's catalogue. Fig. 1 shows a ceiling made up of patterns No. 629, a, b, c. This was shown for the first time at the last Master-Painters' Convention at Plymouth in 1905. Fig. 2 shows a small border or frieze 2½ in. in depth, numbered 70 in the catalogue. Fig. 3 is a similar

border 3½ in. deep, numbered 74. There are many other handsome designs in this catalogue which will appeal to all tastes. The designs for ceilings are especially valuable; sketch plans show how they may be fitted to ceilings of any size. The works of the "Anaglypta" branch are at Darwen, and the London office at 71, Southampton Row, W.C.

A new Flooring and Walling Material.

Messrs. J. & H. Patteson are well known as one of the oldest-established firms of marble, granite and mosaic workers in this country: the firm, in fact, was established in 1805 in Manchester, and has done much work for some of the most eminent architects. They have recently published a finely got-up pamphlet showing illustrations of some of the most important work which they have recently executed, together with a long list of such jobs. One good feature in this catalogue is the reproduction of marbles in colour, printed on the cover. These are very close to actual samples and are most appropriate in their position. We notice an

illustration of an Opus Alexandrinum pavement laid at the Hotel Cecil, London. Such work is not very often seen. It is a form of mosaic pavement which makes great demands on the workers, and there are very few firms which could be entrusted to carry out such work well. Messrs. Patteson are one of these. This kind of pavement is a remarkably rich form of decoration, as architects acquainted with ancient examples in Italy and elsewhere know. We are glad to note that it is being revived to some extent. Messrs. Patteson have just taken up two new materials, namely, "Vitalith" and "Segalith." The first is a composition wall-covering and the second a composition flooring material. "Vitalith" is a hard vitreous substance with a polished surface, made from fine aggregates of marble and stone-dust, &c., cemented together with cement of great hardness and durability. It is decorated with colours, either plain or marbled; is waterproof and fire-resisting; can be washed without damage; and can be fixed as sheets or slabs, or plastered *in situ*. It solidifies perfectly within thirty-six hours.

FIG. 1.—ANAGLYPTA CEILING IN HIGH RELIEF.

FIG. 2.

FIG. 3.

ANAGLYPTA OR SALAMANDER ROLLED PATTERNS.

It should have considerable use in hospitals and other buildings where cleanliness is a desideratum, because it can be worked with curves so as to leave no corners for the accumulation of dust; it also renders the apartment proof against rats, mice or other vermin. "Segalith," the flooring material, is laid *in situ*, and is made with a special cement and aggregates such as sawdust, so that it is warm and pleasant to walk upon. It will adhere perfectly to wood or concrete floors, or any other material for the matter of that, and thus can be used to level-up worn floors. This also solidifies perfectly within thirty-six hours. It is just the kind of flooring for hospitals, workhouses and public institutions where cleanliness is desired. Messrs. Patteson's address is at 7, Bayley Street, Bedford Square, W.C. Among works recently executed by them we may mention:—Manchester Fire Station (Woodhouse, Willoughby & Langham, architects); Union Bank, Manchester (Bradshaw, Gass & Hope, architects); Debenham's New Premises in Wigmore Street, London (J. S. Gibson, architect); Blackley Infirmary (Worthington & Son, architects); Children's Hospital, Hull (J. Bilson, architect); Prudential Buildings, Liverpool (Paul Waterhouse, architect); and Bristol Art Gallery (Frank Wills, architect). We take one illustration from the catalogue showing some fine marble decoration carried out by Messrs. Patteson at the Mechanical Engineers' Institute, London, for Mr. Basil Slade, the architect.

CONTRACT LIST (continued from p. xxi).

June 22. Norwich.—*Colouring, painting, white-washing, &c.*, various schools. The whole of the work to be carried out forthwith. Specifications and quantities may be obtained at the office of C. J. Brown, architect and surveyor, Cathedral Offices, The Close, Norwich, between 10 a.m. and 4 p.m., upon payment of a fee of 5s. per school. Tenders to be sent to the architect not later than noon on June 22, endorsed "Tender for Colouring, &c."

June 23. Runcorn.—*Painting* the Infirmary at the Workhouse, Dutton, as per specification, to be obtained at the Clerk's office, 71 High Street, Runcorn. Tenders on the form supplied to be delivered to George F. Ashton, clerk to the Guardians, 71, High Street, Runcorn, not later than June 23.

June 25. Paisley.—*Execution of the plumber work* of the New District Asylum at present being erected at Dykebar, near Paisley, for the Renfrew District Lunacy Board. Plans may be seen in the office of T. Graham Abercrombie, architect, County Place, Paisley, and copies of the specifications and schedules may be obtained from the Clerk on payment of £2 2s. for each schedule. Sealed tenders, marked "Renfrew District Lunacy Board—Tender for Plumber Work," must be lodged with J. Caldwell, jr., clerk, County Buildings, Paisley, not later than noon on June 25.

June 26. Plymouth.—*Painters', carpenters', and masons' work*, required to be done at certain of the scattered homes for the Guardians. A specification of the work required may be seen at the office of the clerk on application between 10 a.m. and 4 p.m. Tenders, setting out separately the cost of the work to be done at each of the homes mentioned in the specifications, must be sent to W. Adams, clerk to the Guardians, 13, Princess Square, Plymouth, not later than noon on June 26, endorsed "Tender for painting, carpentering, and masonry."

June 27. Canterbury.—*Painting, repairs* and other works in connection therewith at the Borough Asylum. The specification can be seen at the office of W. J. Jennings, architect, Canterbury. Tenders to be delivered to the Asylum, addressed to the Chairman of the Committee of Visitors, not later than 10 a.m. on June 27.

June 28. Edinburgh.—*Painter work* at George Heriot's School, Heriot-Watt College, and Trust Offices. Specifications and schedules of measurement may be obtained from John Anderson, superintendent of works. Marked tenders to be lodged with Peter Macnaughton, S.S.C., clerk, 20, York Place, Edinburgh, on or before 10 a.m. on June 28.

June 28. Chesterfield.—*Cleaning and colouring.*—The Hipper Street and St. Helen's Street Council schools, the work to be done during the month of August next. Specifications and forms of tender may be had from C. J. Kerslake, secretary, Education Offices, Fodlambe Road, Chesterfield, to whom tenders should be delivered not later than June 28.

June 28. Prestwich.—*Painting, paperhanging, &c.*, at the Guardians' Offices, Cheetham Hill Road, Manchester, where copies of the specification can be obtained. Tenders, endorsed "Tender for Painting," to be addressed to Edward W. Ogden, clerk to the Guardians, Union Offices, Cheetham Hill Road, Manchester, and delivered not later than 10 a.m. on June 28.

July 2. Chapel-en-le-Frith.—*Painting, varnishing, &c.* at the High Peak Hospital, Chintley, painters, decorators, &c., carrying on business within the hospital district, which comprises the urban districts of Fairfield and New Mills, and the rural districts of Chapel-en-le-Frith and Hayfield. Specification may be obtained of J. B. Boycott, clerk, Union Offices, Chapel-en-le-Frith, to whom tenders, marked "Hospital Painting," must be sent by July 2.

July 2. Ecclesfield.—*Painting and distempering* required to be executed at the High Green Provided School. Persons wishing to tender are requested to make application to the Divisional Clerk for specification. Tenders should reach W. Hague, divisional clerk, Education Offices, Ecclesfield, not later than July 2.

No date. Leyland.—*Painting* the outsides of sixty-two houses and motor works at Leyland, near Preston. Specification may be obtained from I. Bowman, chartered accountant, 17, Cooper Street, Manchester, or J. Tomlinson, Church Road, Leyland.

ROADS AND CARTAGE.

June 21. Luton.—*Paving* and other works of private improvement in Frederic Street, Beech Road and Oak Road, in accordance with the respective plans and specifications prepared by the Borough Surveyor. Separate tenders for each street, endorsed "Street Improvement," to be sent to George Sell, town clerk, Town Hall, Luton, by 4 p.m. on June 21.

June 21. Nottingham.—*Carting* required in the macadamising of Haydn Road. Form of tender can be obtained on applying to the City Engineer, Guildhall. Tenders to be delivered to the City Engineer by 6 p.m. on June 21.

June 23. Edinburgh.—*Laying of cement-concrete footpaths.* Drawings may be seen at the office of G. Somervell Carfrae, C.E., 1, Erskine Place, Edinburgh, from whom a copy of the specification, schedule, and form of tender may be obtained. Tenders, marked "Footpaths," to be lodged with A. Penry Francis, town clerk, 2, London Street, Edinburgh, on or before June 23.

June 26. Lewes.—*Hiring of steam-rollers and scarifiers* for use upon the main roads during the year ending March 31, 1907, for the East Sussex C.C. Particulars and form of tender can be obtained on application to F. J. Wood, A.M.I.C.E., county surveyor, County Hall, Lewes, to whom tenders, endorsed "Tender for Steam Rolling," are to be addressed and delivered on or before June 26.

June 26. Pontefract.—*Supply of 800 tons of broken whinstone or granite and 500 tons of broken dross.* Specification and form of tender can be obtained at the office of John E. Pickard, borough surveyor, Municipal Offices, Pontefract, to whom sealed tenders, endorsed

"Road Material," accompanied by sample, must be delivered not later than 4 p.m. on June 26.

June 27. Runcorn.—*Supply of about 500 tons of zin. and about 500 tons of 1½ in. broken stone for road metal*, to be delivered in such quantities as may be required; to be Penmaenmawr stone, or stone similar in nature and equal in quality, and to be broken into cubes of the above-named sizes, for the U.D.C. Tenders to state the price delivered at the following places in Runcorn, namely:—Stone Croft, Top Locks, and Crane Wharf, Halton Road; and to be accompanied with samples of the metal to be supplied. Tenders to be sent to E. Marshall, secretary, Town Hall, Runcorn, not later than June 27, and to be endorsed "Tender for Road Metal," and addressed to the Chairman of the Highways Committee. Forms of tender may be obtained on application to the Surveyor.

June 27. Uxbridge.—*Works of drainage, construction of manholes, levelling, herbing, channelling, retaining walls, metalting, and other appurtenant works* in the following roads, all situated in the parish of Uiewsley, Middlesex, close to West Drayton G.W.R. Station, for the R.D.C.:—(1) Tavistock Road; (2) Wimpole Road; (3) Winnock Road; (4) Dock Road; (5) Padcroft Road; (6) Fairfield Road. Drawings may be seen and specifications, bills of quantities and forms of tender obtained at the office of J. Freebairn Stow, engineer and surveyor, Surveyor's Office, Corn Exchange, Uxbridge, on a deposit of £5 5s. Sealed tenders, endorsed "Uiewsley Works," must be delivered at the Surveyor's Office not later than 4 p.m. on June 27.

June 27. Dartford.—*For the following works*, for the Metropolitan Asylums Board:—(1) Repairing, tarpaving and other work at Darenth Asylum, Dartford, Kent. (2) Repairing and remaking certain roads at Joyce Green Smallpox Hospital, Dartford, Kent. Each in accordance with drawings and specification prepared by W. T. Hatch, M.I.C.E., M.I.M.E., engineer-in-chief. Drawings, specification, conditions of contracts, and form of tender for each work may be inspected at the office of the Board, Embankment, E.C., and obtained upon payment of a deposit of £1 each. Tenders, addressed as noted on the forms, must be delivered at the office of the Board not later than 10 a.m. on June 27.

June 27. Barnet.—*Supply of 600 tons and upwards of zin. broken granite* of approved quality (the description to be stated in the tender), delivered in trucks, carriage paid, at High Barnet Station, at the rate of 200 tons per week, for the U.D.C. Delivery to commence on Monday, August 20th next. Also for 500 tons of clean, coarse gravel, and about 450 tons of hoggins, in trucks, carriage paid, at High Barnet Station, as may be required. Tenders, sealed and endorsed "Granite," "Gravel," or "Hoggins," to be addressed to H. W. Poole, clerk, and delivered at the Council's Offices, 40, High Street, Barnet, on or before June 27.

June 28. Greenwich.—*Supplying and landing* at the Council's depot, Banning Street, East Greenwich, 6,500ft. super. of 2½ in. and 6,500ft. super. of 3 in. tooled York stone. Specifications, particulars and forms of tender can be obtained at the Borough Engineer and Surveyor's Office, Town Hall, Greenwich Road, S.E., between 10 and 4 (Saturdays between 10 and 12). Tenders, which must be made on the forms to be supplied at the Town Hall, must be sealed up and endorsed "Tender for York Stone," and must reach Francis Robinson, town clerk, Town Hall, Greenwich Road, S.E., before noon on June 28.

July 2. Arundel.—*Supply and delivery of 500 cub. yds. of unbroken, clean, hand-picked flints.* Forms of tender and conditions may be obtained on application to E. F. Farrington, borough surveyor, Town Hall, Arundel, to whom sealed tenders on the form provided, marked "Tender for Flints," must be delivered not later than noon on July 2.

July 2. Doxford.—*Hire of three steam rollers*, two fitted with scarifiers, to be used on a portion of the main and district roads, for the R.D.C. Conditions of contract to be obtained upon application at the office of F. Clerk, clerk to the Council, Bishop's Waltham, to whom sealed tenders, endorsed "Tender for Steam Rolling," are to be sent not later than July 2.

July 6. Brighton.—*Supply of 1,000 tons of granite spalls.* The specification and form of tender may be obtained on application at the office of the Borough Surveyor at the Town Hall, Brighton. Sealed tenders, endorsed "Tender for Granite Spalls," must be left at the office of Hugo Talbot, town clerk, Town Hall, Brighton, before 6 a.m. on July 6.

July 21. Lewes.—*Supply of 600 tons of zin. broken granite*, 250 tons of coarse granite screenings, and 500 tons of broken surface-picked flints. Forms of tender and specification may be had and any further information obtained at the Borough Surveyor's Office, Town Hall, Lewes. Sealed tenders, endorsed "Tender for —," must be left at the office of Montague S. Blaker, town clerk, Town Clerk's Office, Lewes, on or before July 21.

SANITARY.

June 21. Harefield.—*Extension of the sewer* in Watford Road, Harefield, for the Uxbridge R.D.C. Plan and specification may be seen at the office of the Surveyor any day between 8 a.m. and 5 p.m. Tenders, endorsed "Harefield Sewers," are to be delivered at the office of J. Freebairn Stow, Surveyor's Office, Corn Exchange, Uxbridge, Middlesex, not later than 4 p.m. on June 21.

June 21. Durham.—*Construction of a sewer* at Gilesgate, in the city of Durham. The works consist of laying about 1,200 yds. of 12 in. and 6 in. pipe sewers, with the necessary manholes, flushing chambers, &c. Plans and conditions of contract may be seen and bills of quantities, specifications, and forms of tender obtained on payment of £2 2s. on application to the engineer, Harry W. Taylor, A.M.I.C.E., St. Nicholas Chambers, Newcastle-on-Tyne. Sealed tenders, endorsed on envelope "Gilesgate Sewers," are to be sent to F. Marshall, town clerk, Durham, on or before June 21. It is particularly requested that none but thoroughly experienced master contractors, amply provided with the necessary plant, will tender for this work. Two approved sureties, to the

amount of one-third of the contract sum, will be required for the due performance of the contract.

June 23. Willenhall.—*Sewering, levelling, metalting, paving, herbing and channelling, and making generally* of West Street and a portion of Field Street, for the U.D.C. Drawings and specification may be seen and bill of quantities and form of tender may be obtained for the respective contracts at the office of T. Edgar Fellows, C.E., engineer and surveyor, Town Hall, Willenhall, on deposit in each case of £1. Sealed tenders must be delivered to Rowland Tildesley, clerk to the Council, Town Hall, Willenhall on or before noon on June 23, endorsed "West Street" or "Field Street," as the case may be.

June 25. Penarth.—*Construction of humbling bays, manholes, flushing tanks, and about 580 lineal yds. of stoneware pipe sewers*, varying from 6 ins. to 12 ins. in diameter, for the U.D.C. The 12 in. sewer is about 200 lineal yds. long and will be in tunnel. Plans and specification may be examined and bills of quantities obtained from the Surveyor. Sealed tenders, endorsed "Sewers," must be delivered not later than noon on June 25 to Edgar J. Evans, A.M.I.C.E., surveyor, Council Offices, Penarth.

June 27. Edinburgh.—*Works* required in the execution of proposed clean water drains at Trinity Hospital. Schedule of quantities and form of tender can be obtained on applying to the Borough Engineer, Police Chambers, who will also exhibit the general conditions of contract. Plan, section and detail drawings. Tenders must be sent to Thomas Hunter, W.S., town clerk, City Chambers, Edinburgh, not later than 10 a.m. on June 27, marked "Tender, Blinkbonny Drainage."

June 27. Ramsgate.—*Supply and delivery of glazed stoneware pipes, junctions, &c.*, for the ensuing twelve months. Forms of tender and full particulars can be obtained on application to the Borough Engineer at his office. Tenders, endorsed "Tender for Pipes, &c.," addressed to the "Chairman of the Works Committee," are to be delivered at the Borough Engineer's Office, Albion House, before noon on June 27.

June 27. Kearsley.—*For the following works* for the U.D.C.:—Construction of sewers in Cemetery Road and Bridge Street; construction of sewer in Fletcher Street; construction of sewer in Back Fletcher Street. Plans and specifications may be seen and forms of tender obtained on application at the Council Office. Tenders, endorsed "Cemetery Road and Bridge Street," "Fletcher Street," or "Back Fletcher Street," as the case may be, to be delivered to H. Martin, clerk to the Council, Council Offices, Kearsley, Farmworth, S.O., not later than noon on June 27.

June 27. Bootle.—*Reconstruction of a lavatory, &c.*, in the Town Hall. Plans may be seen and bills of quantities obtained at the office of the Borough Engineer. Tenders, sealed and endorsed "Town Hall Lavatory," to be delivered at the office of J. Henry Farmer, town clerk, Town Hall, Bootle, not later than 9 a.m. on June 27.

June 28. Penycroft.—*Providing and laying* about 210 lin. yds. of 6 ins. diameter stoneware and cast-iron pipe sewers, about 1,130 lin. yds. of 6 ins. diameter stoneware pipe sewers and effluent carriers, the erection of a bacterial filter, sewage distributing outlets, manholes, lampholes, flushing tanks, ventilating columns and other appurtenant works, for the Llantrisant and Llantwit Fardre R.D.C., in connection with the sewerage of Penycroft. Drawings and specification may be seen on application to Gomer S. Morgan, surveyor, School Street, Pontyclun, from whom bill of quantities and form of tender may be obtained, on or before June 22 upon payment of £1. The Surveyor will meet the contractors on the ground at 1 p.m. on June 22. Tenders must be delivered to W. Spickett, clerk to the Council, before 10 a.m. on June 28.

TIMBER.

June 21. London, W.—*Supply of 70 fathoms of best Baltic yellow deal ends*, to be delivered at the Workhouse, Fulham Palace Road, Hammersmith, W., not later than August 12. Forms of tender may be obtained at the office of E. J. Mott, clerk to the Guardians, Guardians' Offices, 129, Fulham Palace Road, Hammersmith, W., and must be returned, sealed and endorsed "Tender for Firewood," not later than 10 a.m. on June 21.

MISCELLANEOUS.

June 26. Heywood.—*Supply of stores and materials*, including timber, picks, spades, iron, steel, oil, waste, tallow, Portland cement, lias lime, coal, brass taps and fittings, iron pipes, lead service pipes, sluice valves, fireplug casings, valve casings, and other stores, for a period of twelve months ending June 30, 1907, for the Heywood and Middleton Water Board. Specification, form of tender, and all other information may be obtained on application to James Diggle, C.E., water engineer, Water Board Offices, Heywood. Fair wages clause. Sealed tenders, endorsed as specified, to be sent in to G. G. Bouchier and F. Entwistle, clerks to the Board, Heywood, not later than June 26.

June 30. Rotherham.—*Supply of the following stores and materials* required by the Tramways Department during the twelve months ending August 31, 1907:—Oils and grease; tools, hardwood, brake blocks; cast-iron brake blocks; paints and varnishes; brass castings; nuts, bolts and screws; river sand, &c. Forms of tenders, specification and further particulars can be obtained upon application to the Tramways Manager, Tram Depot, Rotherham. Fair wages clause. Tenders, endorsed "Tramways Stores," to be sent to W. J. Board, town clerk, Town Hall, Rotherham, not later than June 30.

June 30. Droylesden.—*Supply of the following materials*, for the U.D.C.:—Granite sets, griststone sets, chippings, pitch and oil, earthenware pipes and gulleys, bricks, Portland cement, lime. Full particulars and forms of tender may be obtained from Charles Hall, surveyor to the Council, 10, Ashton Road, Droylesden. Tenders, endorsed "Tender for —," must be sent to W. Richards, clerk to the Council, Council Offices, Droylesden, not later than June 30.

TENDERS—cont. from p. xxi

Doncaster.—Accepted for the erection of a house at Vincent Road, for Mr. Thomas Gill, of Sunny Bar, Doncaster. Mr. E. Hall Ballan, M.S.A., F.I.S.E., architect, Doncaster:—

Dennis Gill & Son... .. £800

Longwith Bassett.—For the erection of a mixed school at Longwith Bassett, near Mansfield, for the Derbyshire Education Committee. Mr. H. Tatham Sudbury, architect, Estate Offices, Ilkeston:—

Haskard, Rudkin & Beck, Leicester £3,560 0 0
G. G. Middleton, Workop ... 3,325 0 0
H. Chattle, Derby... .. 3,260 0 0
G. Haynes, Bolsover ... 3,249 8 0
W. Ford & Sons, Derby ... 3,117 0 0
Maule & Co., Nottingham ... 3,199 0 0
A. Earnshaw, Ilkeston ... 3,172 0 6
J. Greenwood, Mansfield ... 3,149 0 0
A. Eastwood & Sons, Warsop ... 3,120 0 0
C. Vallance, Mansfield ... 3,090 0 0
H. Vickers & Son, Nottingham ... 3,067 0 0
Lund & Swan, Ecdington ... 3,019 0 0
D. Roberts, Ilkeston ... 2,989 0 0
J. & J. Warner, Mickleover ... 2,966 0 0
Lee & Kirk, Chesterfield ... 2,965 0 0
F. H. & J. W. Moore, Shirebrook ... 2,900 0 0
Harris & Hunt,* Ripley ... 2,850 0 0
* Accepted.

Market Harborough.—Accepted for alterations and additions to the workhouse, for the Guardians. Messrs. Coates & Johnson, architects, Bank Buildings, Market Harborough:—

T. Hickman, Market Harborough ... £1,660

St. Fagan's.—For the erection of a residence at St. Fagan's, near Cardiff, for Mr. Robert Forrest, J.P., St. Fagan's. Mr. H. Snell, M.S.A., architect, Penarth:—

J. Moffatt & Sons, Birmingham ... £8,300 0 0
J. Wood & Sons, Worcester ... 8,265 0 0
S. Shepton & Sons ... 8,075 0 0
W. Sapcote & Sons, Birmingham ... 8,050 0 0
W. T. Morgan ... 7,900 0 0
Collins & Godfrey, Tewkesbury ... 7,830 0 0
A. Escourt & Sons, Gloucester ... 7,823 0 0
E. Turner & Sons ... 7,768 0 0
W. Cowlin & Sons, Bristol ... 7,599 0 0
W. Thomas & Co. ... 7,537 3 9
W. Bowers & Co.,* Hereford ... 7,184 0 0
* Accepted. (Rest of Cardiff.)

Seaford.—For the erection of a house. Mr. J. Steward Taylor, architect, Seaford. Quantities by Mr. H. Curtis Card, F.S.I., Q.S.A.:—

D. Lee ... £2,249 11 7
Hudson & Co. ... 1,995 0 0
W. Wilkinson ... 1,777 15 0
G. Godfrey ... 1,776 5 0
J. Martin ... 1,660 0 0

Cook & Sons ... £1,588 0 0
Page & Son ... 1,560 0 0
Godfrey Brothers,* Seaford ... 1,496 10 0
* Accepted.

Watford.—For the erection of a residence, with stabling in the Rickmansworth Road, for Mr. S. H. Timms. Mr. Daniel Eames, architect, 8, Wigganball Road. Quantities by Mr. J. B. Colwill, 60, Gladstone Road, Watford:—

Watkins ... £1,295
Judge ... 1,250
Clifford & Gough ... 1,247
J. & G. Goss ... 1,223
C. Eames ... 1,176
A. & C. Saw ... 1,150
Clark Brothers* ... 1,117
* Accepted.

West Hartlepool.—For infirmary extension and new laundry to be erected within the Union grounds, for the Guardians. Mr. John J. Wilson, architect:—

Laundry. Pavilion.
H. C. Howe ... £1,510 0 0 ... £2,875 0 0
A. Stephenson ... 1,487 6 6 ... 2,593 4 5
J. Howe & Co. ... 1,440 0 0 ... 2,910 0 0
W. M. Thompson ... 1,403 2 3 ... —
Nicholson & Thistle ... 1,402 1 6 ... 2,805 9 5
C. T. Watson ... 1,402 0 6 ... 2,949 7 3
Watt Brothers ... 1,384 14 11 ... 2,804 15 4
E. M. Tweddle ... 1,315 0 0 ... 2,631 14 6
Brazil & Whitton ... 1,285 17 10 ... 2,688 7 8
J. A. Tweddle* ... 1,233 0 0 ... 2,580 0 0
* Accepted.

Wisbech.—For the erection of a house, for Mr. G. F. Glenny, Messrs. George Baines & Son, architects, 5, Clement's Inn, Strand, London, W.C.:—

Kerridge & Shaw, Sturton Street, Cambridge ... £1,651 5 8
* Accepted.

CONCRETE AND STEEL SUPPLEMENT (MONTHLY).

EARLY USE OF REINFORCED CONCRETE.

IN the first number of this "Concrete and Steel" supplement Mr. Thomas Potter, in dealing with the history of the use of concrete, gave a good deal of information regarding the early use of reinforced concrete. We have, however, collected together from various sources further information on the subject with the object of forming a record, and also in the hope that it will lead to a better understanding of the development of this now important branch of construction.

The term reinforced concrete in a wide sense would include all forms in which concrete is strengthened by other materials. It would, indeed, embrace the Roman concrete where tiles were used as facing to walls and a permanent centering to vaults and domes, or wooden laths and timbers used to stiffen plaster walls as in half-timber work, but we only propose to trace the history of concrete reinforced with iron, and it should be more particularly confined to the use of iron in small sections where the concrete takes part of the stresses.

Fox & Barrett's Floor.

Fox and Barrett's floor was described by Mr. Potter in the article above referred to. It was patented in 1844, but it was first invented by Dr. H. H. Fox in 1833, and used in that and the succeeding year in the erection of a lunatic asylum, Northwoods, at Frampton Cotterell, near Winterbourne, Gloucestershire. Cast-iron joists were used, fixed 18 ins. apart. Laths were laid between and plaster squeezed in; lime concrete was then filled in between. Fox & Barrett's floor was used at St. Mark's College, Chelsea; Guy's, the Foundling and Brompton Hospitals, Balmoral Castle, the Wiltshire Lunatic Asylum and many other buildings.

In 1840 M. Louis Leconte, a Frenchman resident in London, patented in England a system of using iron flitch plates in connection with wood, and transverse iron rods connecting the whole, filled in with a plaster-of-Paris concrete. He appears to have used a form of metallic lathing, which also helped to support the concrete until it set.

In the second edition of Fairbairn's book "On the Applications of Cast and Wrought Iron to Building Purposes" (published in 1857-8), he describes how floors were constructed in Paris with iron bars placed on edge and rods running between, upon which plaster-of-Paris concrete was deposited. Figs. 1 and 2 show these floors, and the following is Fairbairn's description:—

A system of fireproof flooring has been in use for some time on the Continent, and indeed has been partially employed in this country. In France two principal systems have been introduced, called respectively the *Système Vaux* and the *Système Thuasné*, from the names of their inventors. In the *Système Vaux* it will be seen that the beams for supporting the flooring consist of simple plates of wrought iron, split and bent at the end to obtain a firm holding in the wall. These are bound together by tie-rods, which are crossed by other rods supporting the ceiling. In the *Système Thuasné* wrought-iron flanged joists have been substituted for the plates, and a different method of attaching the tie-rod is employed. The beams . . . vary in depth, thickness and length, according to the width of the room and the length of the span. At first they were placed at distances of 1 metre apart = 3 ft. 3½ ins.; but that distance was found to be inconvenient, not giving sufficient strength and rigidity to the floor; and hence they are now placed at about 2 ft. asunder. The usual manner of forming the ceiling is to force upwards against the bottom of the iron

joists flat boards, which answer as a centering, and then to fill up the spaces between the joists and tie-rods to a depth of 2½ ins. or 3 ins. with a coarse grout of plaster-of-Paris.

Mr. H. H. Burnell described these floors, however, in a paper read before the Royal Institute of British Architects in January, 1854, with illustrations. He stated that the Vaux system came into general use in the spring of 1852. Mr. G. R. Burnell had, however, in a paper read before the same body in 1849, referred to Vaux's system. It may be mentioned that square rods were used in both systems, which is not clearly shown in the diagrams. The floors of the New Louvre were built on the Vaux system.

In 1852 Robert Mallet obtained a patent for using wrought-iron joists, with arched plates resting between, upon which concrete was deposited.

The Inventor of Reinforced Concrete.

In 1854 Mr. W. B. Wilkinson, "a plasterer and manufacturer of artificial stones," of Newcastle-on-Tyne, took out a patent for fire-resisting construction in which the fundamental principles of modern reinforced concrete construction are embodied. Not only does this patent cover the reinforcement of floor slabs with crossing iron bars, but it shows how to reinforce concrete girders or beams to sustain these floor slabs. It is plain from the patent specification that Mr. Wilkinson clearly understood the subject, and had practically investigated the principles involved. His was no blind leap in the dark, and it seems that he must be acclaimed as the real inventor of modern reinforced concrete, where the metal is only introduced to strengthen the concrete in tension, designed on a scientific basis. This patent also is the first to suggest the construction of tubular partitions with keyed joints. He founded the firm of W. B. Wilkinson & Co., Ltd., of Newcastle-upon-Tyne, which is well-known for its work in plain and reinforced concrete to-day. We are informed by this firm that some years ago a fire unfortunately occurred at their offices and destroyed all the old books and papers, so that the particulars of early contracts (of which many important ones are known to have been carried out in the 'sixties and 'seventies), executed by the firm. As this patent is of such interest we publish the following abstract. The illustrations have been redrawn, so as to bring out the essential details more clearly than the original drawings in the specification do. We would draw particular attention to the way in which the tension members are inclined upwards towards the supports following the bending moment, the continuity of beams over supports, the separation of the ends of the tension members and twisting round rods to

avoid pulling out; and in the case of the arched floors the short lengths of iron introduced at the abutments—all of which are to be found in latest practice. The following is an abstract of Wilkinson's patent specification (dated October 27th, 1854, and sealed April 3rd, 1855):—

In constructing the floors of dwelling houses or warehouses, formed during the progress of the building with ceilings of an arched form, the walls of the building are to be carried up to the requisite height for the first floor; a centering is then to be firmly fixed over the whole area intended to be floored and boarded with narrow strips, leaving a small space between each, if the ceiling be for a dwelling house, and very slightly nailed, to keep them in position. The material to form the floor and ceiling is composed of crushed bricks, metallic scoria, or other hard substances (which, however, must be free from soil or other extraneous matter), and Portland or other cement of equal quality. These materials may be mixed together in the proportions of three parts of crushed hard-burnt bricks and scoria, sifted through a riddle of about 2 in. mesh, one part of hammer-broken stones or bricks, or other hard substances, reduced to about the size of zins. diameter, one part of the same material hammer-broken and reduced to about the size of a quarter brick; the whole is then to be well incorporated. The three parts of zin. scoria and burnt bricks are then mixed with water, to which are afterwards added two parts of the coarser material, the whole being well worked together with the cement to produce perfect adhesion. This mixture when ready is thrown on to the centering, and beaten in solid, the coarser portions in the haunches and the finer parts towards the crown of the arch. As the larger portions of the broken bricks, &c., would not lie conveniently over the crown of the arch, where the thickness is much less than at the haunches, a number of strips of hoop iron laid on edge are imbedded in the mass across the crown of the arch, at distances of about 2 ft. asunder, or at greater or less distances, according to the desired strength of the floor, and reaching the full length across the floor or floors, the under edge of the same being set at or near the crown of the centering, so that in this low position the strips may act with more power as tension rods to the floor. The concrete is filled up to the desired level, and if for dwelling houses or warehouses for the storage of light goods, it may be trowelled smooth and finished in cement, or laid with boards. If a wood floor is desired, strips of wood may be imbedded or dovetailed into the cement, to which strips the flooring boards are nailed. When the first floor has been formed, it must be protected from injury by being covered with thin deals, laid on a stratum of sifted sand, which will assist in keeping the concrete moist for a longer period than if it were exposed to the free action of the air, slow drying adding greatly to its strength and durability. The centering should not be removed until the concrete has become sufficiently set, which will be at the expiration of about a month, the walls of the next storey having been built in the meantime to act as an abutment to the arch. The rest of the floors as well as the roof may be constructed in a similar manner, care being taken to give a sufficient rise to the middle of the roof, to throw off the wet into a channel or gutter at the front and back; or, if preferred, a slated roof may be put on the top in the usual manner. The floors formed in the manner herein-before described will admit of brick partitions being set upon them in positions where a wooden floor would not admit of. The peculiar construction and arrangement of these partitions will be hereinafter more particularly described and referred to. The stairs may be of stone, or of the same material as the floors, which will be considerably cheaper and as good.

For warehouses the arch and supporting walls are made of additional strength. When ceilings of arch form may be objected to, and when it may be necessary to execute works with despatch, as in putting in new floors to old buildings, in place of the method herein-before described a flat platform of wood is to be erected to the ceiling line, and the floor to be composed of plaster, air-slacked lime, cut hay, and ashes and breeze in certain proportions, and wire rope (which may be procured second-hand in considerable quantities), or iron in other forms in a state of tension, hollow bricks, field drain pipes, coke in lumps, &c., being introduced, if desired, to lessen the weight. A floor of this construction is shown on the

FIG. 1.—Système Vaux.

FIG. 2.—Système Thuasné.

FIG. 3.—WILKINSON'S 1854 SYSTEM OF REINFORCED CONCRETE.

drawings. The wire rope is secured at its extremities at each line of support by imbedding it in the mixture or concrete while in a soft state, and forming the ends into loops, or by opening out the strands and hirling them in various directions, which renders it so secure as not to be drawn out under any force short of the breaking weight of the rope. In ordinary dwelling houses I propose placing such wire ropes about 9 ins. apart, and to have a full depth of floor of one-sixteenth the span; so that for a span of 16 ft. I should have a flooring of 1 ft. in depth, the breaking weight of which is calculated at 2½ tons per superficial yard. . . . Fig. 4 represents the fireproof partition hereinbefore referred to, the beam supporting the same. . . . In lieu of the ordinary lath and plaster, these partitions are composed of Paris plaster alone, or of plaster-of-Paris and air-slacked lime, cast in blocks of a cellular form. The cavities or cells run horizontally, and the blocks are dovetailed together at the joints, and united with strong gauged plaster-of-Paris and lime, putty, or air-slacked lime; they are set fair and dressed with scrapers, forming a surface suitable either for paint or paper. This partition may be used on ordinary wooden floors, and is not more heavy or expensive than lath and plaster partitions. In some cases this partition may be supported on a beam composed of wire ropes, plaster, cut hay, &c., as shown.

J. L. Lambot's Patent.

The following year, 1855, we find a M. J. L. Lambot, stated to be of Carces, Department of Var, France, and 32, Essex Street, Strand, London, taking out a full patent in France, and a provisional patent dated February 13th in this country. As this latter is short we will give the full description, which is as follows:—

"A building material to be used as a substitute for wood in naval and architectural constructions, and also for other domestic purposes where dampness is to be avoided. I make this substitute of a network or parallel set of wires, or metallic bars or rods, imbedded or cemented together with hydraulic or other cementing matter, so as to form beams or planks of any suitable size."

This is probably the inventor referred to by L. J. Mensch in "Reinforced Concrete Constructions," an American book published in 1904, in the following words:—"The first reinforced concrete structure which came

to public notice was exhibited at the World's Fair in Paris in 1855. It was a small row-boat built by a Mr. Lamont (*sic*), of a shell of cement mortar 1½ ins. thick, and reinforced by a wire netting. It is still in service in a pond in Miraval, France."

François Coignet.

In the same year M. François Coignet, of Paris, took out patents in both France and England. Whereas the French patent only dealt with the making of concrete from hydraulic limes and various aggregates, the English patent included reference to the construction of reinforced concrete floors. It was not until 1858 that he obtained the extension of his French patent which describes this system of reinforced concrete.

The paragraph referred to in his English patent, dated November 26th, 1855, is as follows:—

This new description of floorings is established by laying on the walls to support the flooring a certain number of iron stop planks, parallel one to another, and reposing on the walls by their ends, so as to be completely supported by the whole thickness of the wall. The number and strength of the said iron planks is in proportion to the pitch and to the area of flooring to establish; for instance, for a flooring of 15 ft. to a side, or 225 sq. ft., I have employed three iron planks 4½ ins. deep, of which 3 ft. weighed about 22 lbs.; but instead of iron planks I can establish iron rods placed at convenient distances apart one from the other, and traversing through and through the four walls supporting the flooring, so that these iron rods cross symmetrically one another and look somewhat like a chess-board. These rods, being in the shape of a screw and having a nut at each end, will prevent the walls from losing their perpendicularity. Should the flooring have a great span and a large area, strong iron beams would be placed at convenient distances, and the iron planks and rods would rest on the beams.

FIG. 4.—WILKINSON'S 1854 HOLLOW PARTITION AND SUPPORTING BEAM.

FIG. 6.—HYATT'S PATENT FLOOR WITH SHEAR MEMBERS.

FIG. 5.—ONE OF HYATT'S PATENT FLOORS.

M. Coignet then goes on to describe the placing of the centering and the filling in of the concrete.

Dennett's Floors.

In 1857 Mr. C. C. Dennett took out his patent for a fireproof floor, which has become familiar as carried out in many important buildings by Messrs. Dennett & Ingle. Mr. Dennett provided in his patent for strengthening the crown of concrete arches, resting on walls or joists, by embedding lamina of wood or iron therein.

M. Allen and F. Ransome.

In 1862, Mr. Matthew Allen, a builder of Finsbury, took out a patent. His system was to use 3in. by ½in. bars fixed on the walls, 2ft. apart, and crossed by ½in. rods also 2ft. apart.

Mr. Frederick Ransome in 1865 provisionally protected the strengthening of slabs, bearers, &c., by moulding the concrete round hoop iron.

Monier System.

In 1867 Monier took out a patent in France. M. Monier has been acclaimed as the pioneer of reinforced-concrete, but we see that he was antedated by several others. Even in 1867 Monier had not realized the possibility of using his invention for structural work. The 1867 patent is for strengthening concrete flower-pots with a wire mesh. It was not until 1873 that he took out an extension of the patent to cover its use for reservoirs, bridges, &c. In 1879 Monier exhibited his system in the Antwerp Exhibition, where Herr G. A. Wayss noticed it and bought the German patents. Experiments were carried out, the system thoroughly studied, and its use pushed with vigour.

Hyatt's Researches.

Between 1873 and 1881 Mr. Thaddeus Hyatt, an American, took out between thirty and forty patents for reinforced-concrete constructions. He carried out a series of experiments, and Kirkcaldy tested a number of beams for him in 1877. The results of these experiments he published in 1877 in a book printed for private circulation. We reproduce several illustrations from this book of test beams and the forms adopted practically by him. It will be noticed from Figs. 7 to 11, that not only did Mr. Hyatt invent beams with double reinforcement, but adopted inclined reinforcements and also vertical reinforcements to take the shear, which are rigidly attached to the bottom tension members. Fig. 11 shows a beam with only four vertical stirrups or hangers, but others of the same size were tested with ten.

Mr. Hyatt, it may be mentioned, was the inventor of the "Lens" pavement lights, which, after getting largely adopted in the United States for basements, he introduced in this country. To advertise his reinforced concrete system he built large works for these pavement lights in Farringdon Road, London, at a cost of £20,000, but the building was

some time ago reconstructed and his floors removed. Mr. Hyatt's firm still has an office a few doors away. The construction adopted in the building referred to is shown in Figs. 5 and 6. The former shows "the ceiling holders" which were slipped over the flanges of the joists, with the crossing wires "which form an entangling meshwork to hold the concrete." Fig. 6 is described as dispensing with the floor joist, "flat tie-irons being substituted for the joists; the concrete in this case becoming the compressive member of the beam or slab. Numerous buildings were erected on his system in the United States, but it did not make much headway here.

Mr. Hyatt proved that the expansion of concrete and steel was the same at even high temperatures. A system of calculation was also suggested, but the data determined regarding the proportions, strength and modulus of elasticity of the concrete were insufficient for adequate treatment.

Ransome.

Mr. Ransome, of the United States, introduced his system of reinforced concrete with twisted rods about 1880.

Stuart's Granolithic.

About this time Mr. Stuart, a Scotch plasterer, who founded the present firm of Stuart's Granolithic Stone Co., Ltd. was also introducing rods to reinforce concrete in tension. In fact this firm was one of the first to carry out reinforced concrete on an extensive scale in this country.

It is now close on eighteen years since Messrs. Stuart began an extensive series of experiments for floors and beams in concrete, reinforced with steel rods. Before this steel rods had been employed in their paving. It

Fig. 7.

Fig. 8.

Fig. 9.

Fig. 10.

Fig. 11.

FIGS. 7 TO 11.—BEAMS TESTED BY KIRKCALDY FOR THADDEUS HYATT IN 1877.

is not, however, more than fifteen years since they applied the combination of small steel rods and concrete to floors and beams with large spans for buildings of magnitude. These buildings, after a lapse of many years, show no depreciation whatever so far as the floors are concerned.

The following are a few of the buildings where Messrs. Stuart carried out reinforced concrete work, arranged in chronological order:—Sanderson's factory, Chiswick; Mar Lodge, Braemar, for the Duke of Fife; Selwyn College, Cambridge (under Sir A. Blomfield, architect); Straker's premises, Whitefriars; Walsli's huge drapery establishment, Sheffield; Nottingham Borough Asylum; C. Jenner & Co.'s premises, Edinburgh; Belgrave Mansions, in the West End of London; Birmingham Technical School; Horton Asylum (under Mr. Hine, architect); Rauby Asylum, Sleaford; and Cowen's Paper Factories, Upper Thames Street, and at Penicuik, Midlothian. These are many years old, and all the floors there are ferro-concreted. Sanderson's factory was done probably fifteen or more years ago, and was promoted by a mere boy: an architect who had the courage of his convictions, young Ernest Sanderson, who died before the job was very far advanced, being completed by Mr. Catherwood, architect, of London.

Expanded Metal.

In 1884 Mr. Golding, an American citizen, patented expanded metal. At first this was only used as lathing for plasterwork, but in time it was manufactured of heavier gauge and used in various well-known ways.

The first Reinforced Concrete Column.

Messrs. Lee & Hodgson took out a patent in 1885 which is interesting as apparently the first idea for a column or pillar of concrete reinforced with metal. The construction described in the specification and illustrated, consists of spirally coiled metal, crossing so as to form a trellis. If necessary, straight bars were placed vertically to stiffen the framework. The columns were to be constructed solid or hollow.

Lindsay's System.

In this same year, 1855, Mr. W. H. Lindsay patented his system of reinforcing the concrete between floor-joists with rods, a system that has been extensively employed by Messrs. William Lindsay & Co., of 23, Queen Anne's Gate, Westminster.

The Present Coignet.

M. Edmond Coignet, son of the M. François Coignet above referred to, stated his ideas regarding reinforcement of concrete in 1888 before the French Society of Civil Engineers, and he read a paper on methods of calculation with M. Tedesco before the same society in 1894, which was practically the starting point of modern theory.

Cottancin and Hennebique.

Mr. R. J. P. Cottancin patented his well-known system in both France and England in 1891, and M. François Hennebique, an engineer then resident in Brussels, took out his patent in 1892. The latter system is dealt with elsewhere in this issue.

The rest is modern history.

Reinforced Concrete Foundation Work, &c.

It is interesting to note that the following works have just been completed on the Coignet system of armoured concrete for the new premises for Messrs. J. C. & J. Field, Ltd., at Rainham, Essex:—Foundation beds for three Galloway boilers, foundation beams for two buildings, large coal bunkers, foundations for shaft and economizers, and also two small bridges. The architects are Messrs. Scott, Hanson & Fraser, of London, and the contractors are Messrs. W. King & Son, of London. Armoured concrete has proved most valuable for these foundations amongst the multitudinous things that have to be taken into account in drawing up a scheme of construction.

GENERAL VIEW OF WORK AT "MORNING POST" BUILDING, LONDON. MEWES AND DAVIS, ARCHITECTS. WARING WHITE BUILDING CO., LTD., CONTRACTORS.

THE "MORNING POST" BUILDING.

In our first "Concrete and Steel" Supplement we published a photograph and sectional diagram of the concrete retaining wall which has been constructed at the new "Morning Post" building now in course of construction in Aldwych, London. We also published a

few particulars regarding this steel-frame building, the architects of which are Messrs. Mewes & Davis, the contractors being the Waring White Building Co.

We now give a view looking down the excavation and showing the manner in which the timber was put in, in short lengths as the work of excavation was done. It was of course most important that no subsidence should occur, and the photograph shows the exceptional care which was taken to avoid anything of the sort.

Present Condition of the Building.

We also publish three photographs taken on Friday last showing the present state of the construction of this building. The general view of the site, published on this page, shows the retaining wall completed and the intermediate mound of earth being rapidly removed.

The Steelwork.

At the end of the site nearest the Strand it will be seen from views on the next page which were taken of this portion that the steelwork is rapidly rising. These detailed views also show the retaining wall at this corner. One of the views shows the large circular girders which are an important feature of the work. There are a considerable number of these, as the building comprises several storeys, and there are three circular corners.

It is not often that circular girders are used and the design of these is interesting. We shall publish further particulars and illustrations later on. It may be mentioned, however, that the usual plan is to run out cantilevers over a straight girder, the former supporting the circular front wall. This is an easy method of dodging the difficulties entailed in the design of a circular girder. The details of the connections, shown in our views, are also deserving of study as examples of economical design.

We shall publish some of the steelwork detail drawings later, for which Mr. S. Bylander is responsible. Mr. Bylander, it will be recollected, was the engineer who designed the steelwork of the Ritz Hotel, Piccadilly.

FIG. 1.—ROTATING STONE CRUSHER.

CONCRETE MACHINERY.

By Prof. Henry Adams, M.I.C.E.

Stone Breakers.

WHEN stone is required for the aggregate in concrete, or for ballasting a railway, or for road metal, it is necessary that it should be crushed to a convenient size. This is sometimes done by hand-labour, but if a large quantity is required a considerable saving will be effected by using one of the many varieties of stone-crushing machines, either of the rotating or hammer action pattern. Fig. 1 shows a stone crusher of the rotating pattern, one of the outer jaws being open to show the internal arrangement for crushing, the arrangement being very similar to the domestic coffee-grinding mill but on a very much larger scale. The lumps of stone are put in at the top and, coming in contact with the revolving ribbed cones, which are fixed to a central shaft, are crushed smaller as they descend, and finally the stone emerges

from the bottom, broken as fine as required. It is important that the aggregate for concrete should be of a varying size: for general foundation work the largest pieces should not exceed $1\frac{1}{2}$ ins. in any dimension, while for fireproof floors 1 in. should be the maximum, some experts preferring that it should not exceed $\frac{3}{4}$ in. It should be graduated from the maximum down to, say, $\frac{1}{4}$ in., and the finer material, freed from dust, may be used in place of sand in sufficient quantity to fill the voids. Fig. 2 shows a "hand-hammer action" stone-breaker. Every revolution of the crank shaft *r* causes the lower end of the movable jaw *D* to advance towards the fixed jaws *C 1, C 3* about $\frac{1}{8}$ in. at the bottom. Hence if a stone be dropped in between the convergent faces of the jaws it will be broken by the next succeeding knap, which is given 250 times per minute; the fragments will then fall lower down and be broken again, and so on until they are small enough to pass out at the bottom, the distance between the jaws

FIG. 2.—SECTION OF STONE BREAKER.

FIG. 3.—ELEVATION OF STONE BREAKER.

at the bottom limiting the size of the fragments. The distance (and consequently the size of the fragments) may be regulated at pleasure; a variation to the extent of 1 in. may be made by raising or lowering the wedge *M*, which moves the toggle block *L* forward or back. Further variation may be made by substituting a longer or shorter toggle plate *J* as required. The machine is driven by a belt on the pulley *Q* or the flywheel *P*, keyed on the crank shaft *r*, which makes 250 revolutions per minute; on this crank shaft is the connecting rod *G*, the lower end of which is connected to the frictionless lever *H* by means of the shaft *O*, and is fulcrumed at the point *R*, this lever being again connected by the toggle plate *J* with the movable jaw *D*. *C 1, C 3* are the fixed jaws against which the

FIG. 5.—CONTINUOUS CONCRETE-MIXER.

FIG. 4.—GRAVITY CONCRETE-MIXER.

stones are crushed, these being held in place by side plates c, which fit in recesses in the interior of the frame on each side. The movable jaw d is supported by shaft e, which forms the pivot upon which it vibrates. w is a steel spiral spring, which is compressed by the forward movement of the jaw and aids its return. T, s, r are renewable steel bearings. The jaws c 1, 3, 4, 5 are reversible (top to bottom). The connecting rod and the lever are made of solid crucible cast steel. Fig. 3 shows the external arrangement of the machine, with a slightly inclined perforated revolving cylinder, down which the stone passes when crushed. These perforations are smallest near the top end of cylinder, to allow the small stuff to drop through while retaining the larger and coarser material, which passes lower down the cylinder, then finally through larger holes.

Concrete-mixers.

The mixing of the ingredients for making concrete was at one time performed entirely by hand-labour, but in recent years many different forms of concrete-mixers have been introduced with a view to economy and the production of concrete of less varying qualities. The machines may be divided into two classes—(1) gravity mixers (Fig. 4), in which bars and plates are arranged so as to retard the passage of the ingredients while travelling from top to bottom, causing them to become completely mixed by the time they reach the bottom; and (2) mechanical mixers, which are again sub-divided into (a) "continuous" mechanical mixers, which require a constant feed and give a continuous delivery, and (b) "batch" mechanical mixers in which a given quantity of material is placed in the machine at one time, mixed and delivered, and the mixer is then ready for another charge. An illustration of a continuous concrete mixer is shown in Fig. 5, the ingredients being raised into position by means of a bucket elevator and passed into the revolving horizontal cylinder, which has blades fixed to the central shaft; these blades revolve at a different speed to the cylinder, and so prevent the concrete from clinging to the sides. The water is carried along the horizontal shaft and sprayed on to the contents of the cylinder while in motion, and the concrete when mixed is discharged from the end of the cylinder. An American "batch" concrete-mixer is shown in Fig. 6, the ingredients are placed in the drum, on the inside of which steel scoops and deflecting blades are riveted as shown in Fig. 7, which is a sketch of part of the interior, and as the drum revolves these scoops and blades turn the materials over somewhat similar to a man with a shovel. When thoroughly mixed the steel shoot is lowered and the contents of the drum slide down into the barrow or cart underneath. In English "batch" mixers the materials are fed into a revolving drum in which are arranged blades and scrapers. The ballast is raised to the required position by means of a bucket elevator, and the water is measured in a tank provided with a ball-cock. The whole machine is portable and is raised above the ground sufficiently high to allow small wagons to pass underneath to receive the charge of concrete when mixed. As the concrete-mixer cannot always be in the exact position required for the concrete when finished, it is important that the method of transporting the mixed material should be as rapid and easy as possible. The illustration (Fig. 8) shows a concrete cart capable of holding 6 cub. ft. of concrete, and when full and running on planks this cart may easily be hauled by one man. The carts are made of steel, and when used in conjunction with the American concrete batch-mixer they may be filled very rapidly. Under certain circumstances the concrete may have to be raised or lowered from one position to another, and when this is the case dumping

FIG. 6.—AN AMERICAN "BATCH" MIXER.

FIG. 7.—INTERIOR OF DRUM.

FIG. 8.—CONCRETE CART.

FIG. 9.—CONCRETE BUILDING BLOCK MACHINE.

buckets fitted to cranes may have to be used.

Concrete Block Machines.

Of recent years many attempts have been made to introduce concrete building blocks, somewhat similar to terra-cotta blocks, to take the place of the ordinary bricks in building, and for this purpose machines as shown in Fig. 9 have been invented which are capable of making a considerable number of similar blocks in a day. They may be made hollow or solid. By changing the moulds blocks of various patterns may be obtained, and the surfaces to be exposed when erected can be made to suit the taste of the architect. There is, however, some uncertainty as to the strength of these blocks, as they result from the pressing of dry materials with only enough water added to give them the consistency of moulding sand, so that the full strength of the cement cannot be developed. Some improvement is obtained by "curing" the blocks, or keeping them moist for a considerable period. For such work as landings, stairs, &c., the concrete freshly mixed in a moist state is frequently pressed in zinc-lined wooden moulds made to the necessary shape, but the chief drawback of this method is the time and space required for storage while the concrete is maturing. For building groynes and sea walls the concrete blocks are made solid of a large size, weighing 2 cwts. and upwards, and are often filled by hand in wooden moulds with the face upwards, in which flints are embedded while the material is soft so that an ornamental appearance may be obtained.

The new Chapel in St. Paul's Cathedral which was dedicated last week is on the right as the visitor enters the great west door, and was originally the Wellington Chapel. The entire work was carried out under the superintendence of Mr. Somers Clarke, architect to the Dean and Chapter.

A REINFORCED CONCRETE NEWSPAPER OFFICE.

WE publish two further working drawings for the reinforced construction of the annexe to the "Dundee Courier" building now approaching completion in Dundee. These should be compared with the drawings reproduced in our first "Concrete and Steel" Supplement, where also a general description of the work is given. These two drawings now reproduced show the framing plan of the first floor with details of the beams. The drawings are self-explanatory.

Messrs. Patman & Fotheringham, Ltd., of 100 and 102, Theobald's Road, W.C., have secured the following rebuilding contracts:—Fowkes Buildings, Great Tower Street, E.C.; Seaman's Mission Hall, Tilbury Dock; "Lyric Tavern," Shaftesbury Avenue, W.C.; large mansion at Cookham Dene, Bucks; 57 and 59, Great Portland Street, W.

A Large Reinforced Concrete Chimney is to be erected for the Associated Portland Cement Manufacturers (1900) Ltd., at their Knight, Bevan and Sturge Works, Northfleet, Kent, by the Weber Steel-Concrete Chimney Co., Ltd., of Westminster. Its total height from base of foundation to top will be 247ft., the diameter of flue 8ft. 6ins., and the foundation 18ft. square. The weight of the chimney, including the base, is 868 tons. A similar chimney, the first reinforced concrete chimney in this country, is now being built at Messrs. Abram Lyle & Sons' (Ltd.) sugar refinery at Plaistow Wharf, Victoria Docks, which has a total height of 261ft., a diameter of flue of 20ft., and a base of foundation of 25ft. square. The cement is being supplied by the Associated Portland Cement Manufacturers. Both of these chimneys are designed to withstand a wind-pressure equivalent to a velocity of 110 miles per hour.

SHEAR STRESSES In Beams of Steel and of Reinforced Concrete.

By Prof. Robert H. Smith,
A.M.I.C.E., M.I.M.E., M.I.E.E., &c.

(Continued from p. 6, No. 589.)

WE take next a stress law which is in itself independent of strain or elastic laws, but the application of which to beams depends entirely upon whether the elastic modulus remains the same or varies throughout the section. In Fig. 2 is sketched a small

Fig. 2.

rectangular portion of the beam similar to that in Fig. 1. The tension τ varies along the horizontal, i.e., along the line of τ itself, and its rate of variation per inch of length is called τ' , so that at the right-hand end of the rectangle its intensity is $\tau'b$ greater than at the left-hand end, and the difference of the two opposite pulls at the two ends upon the area $a \times$ unit thickness perpendicular to the view shown, equals $\tau'ab$. If there be no mass acceleration this must be balanced by other stresses, and cannot be balanced by any difference between the K 's on upper and lower surface because these are wholly vertical. The $\tau'ab$ must be balanced by the $s'ab$, where s' is the rate per vertical inch of the variation of the shear stress acting over the horizontal surface $b \times$ unit thickness. In equating these the product ab cancels from each, and leaves the very important stress law

$$s'_v = T'_h$$

where the suffix v indicates a vertical variation and the suffix h a horizontal variation, each being per inch distance between successive horizontal and vertical sections. The same law applied to the horizontal variation of s gives

$$s'_h = K'_v,$$

the s'_h being increase of s towards the right and K'_v a downward decrease of the compression x .

Thus so soon as we know how τ , the tension, varies along horizontal lines, we can calculate how s , the shear, varies across a vertical section.

Distributed Loads Assumed.

Consider two vertical sections only a short distance b apart, and over this short distance let the load on the beam be distributed; that is, let there be no sharply concentrated load applied inside this short distance b . This is an easy supposition, since no load can by any physical possibility be sharply applied in the mathematical sense of the term: it is necessarily distributed over at least some short length of the beam. Then, if F be the total shear force on either vertical section, rb is well known to be the difference between the two total bending moments on the two sections.

Now, however, the steel and concrete may be relatively disposed across the section of a reinforced concrete beam, there is never any sudden change in this relative disposition of the two materials from one vertical section to another close to it—except at the ends of metal bars. We may assume that these metal ends are not located in places other than where there is an excess of strength and where minute estimate of the risk of breakage is unnecessary. It follows that the normal stresses combining to yield the bending moment are similarly distributed over such neighbouring sections, and that the bend-

ing moment $M = \mu T_m \frac{I}{H}$, where T_m is the

upper or lower surface stress and H the whole section depth, μ a numerical coefficient the same for both sections, and I the moment of inertia of the section properly calculated in view of the different materials occupying different parts of it. I is proportional to H^4 unless there be sudden change in the ratio of steel to concrete sections or sudden change in the proportions of the outline of the total section. If the change in $\frac{I}{H}$ between two

neighbouring sections be nil, or be neglected, we may write the difference of the two moments $rb = \mu T'_m \frac{I}{H} b$, where T'_m is the rate per inch horizontal at which T_m varies. This gives at top or bottom surface

$$T'_m = \frac{FH}{\mu I}$$

and at any level

$$s_v = T'_h = \frac{\tau FH}{\mu I}$$

where τ is the ratio between the tension τ at any point of the section to the surface tension T_m , this ratio being the same for similar points in neighbouring sections. Here $\frac{FH}{\mu I}$ is the same all over any one vertical section, and this equation gives the means of investigating the distribution of the shear over each such section so soon as we know the distribution of normal stress on it. Thus a preliminary to the calculation of the shear stresses is a correct estimate of the distribution of the normal stresses.

Up to this point all that has been formulated is equally true for heterogeneous and homogeneous material; the mixture of materials makes no difference to any of the above results. For instance, the small depth a in our diagrams Figs. 1 and 2 may cross from concrete into steel, or from cement mortar into a bit of hard rag-stone, or into a bit of brittle or crumbly cinder.

Assumption of Plane Sections Foolish.

In all the engineering text-books expounding the ordinary elementary elastic theory of beam bending it will be found stated that this theory is based on the assumption that sections which are plane in the unstrained condition remain plane in the bent condition, and this base hypothesis is found repeated in all the recent applications of theory to reinforced concrete. These latter in American books are terrifying in the ghastly masses of algebraic symbols piled up recklessly on this base foundation. This assumption is often even stated to be that these transverse sections remain everywhere perpendicular to the bent and curved neutral axis. No more amazingly foolish statement of hypothetical basis can be conceived. Because every student of the subject who has gone beyond his $wL = \frac{3}{8} T B H^2$ knows that, according to the theory supposed to be so based, the shear strain varies rapidly across each section from zero to a maximum. A shear strain means a deviation from perpendicularity between sections which were perpendicular before straining. If the shear stress were equally distributed over the section, then the section would still be plane, but it would no longer be perpendicular to the neutral axis. But as the shear strain is known to vary across the section, therefore the deviation from perpendicularity to the longitudinal fibres varies, and therefore the section is not plane but curved. The curvature is, of course, small; but all the strains, corresponding to very heavy stresses, are equally minute. The curvature is of the same order as that of the neutral axis. The most amazing part of this psychological phenomenon is the extraordinary fact that in the development of the beam-theory not once from beginning to end is the smallest, not

even the most remote and indirect, use made of this assumption which is said to be its basis.

Curve after Bending.

The curve assumed after bending by each originally flat cross-section is a somewhat complicated one; but those assumed by two neighbouring sections close to each other are similar, the one is almost a repetition of the other, differing only very slightly in the scale of its horizontal ordinates, that is, in the amount of tilt out of perpendicularity to the neutral axis. This is true so long as there is no sudden large change of size or shape between the two contiguous sections. If such sudden change does occur, then for the passage from one to the other size or shape the whole ordinary theory of bending falls to the ground, and well-known dangers of cracks arise which are clearly indicated by the completed but much more difficult theory. In the absence of such sudden change, the two similarly curved neighbouring sections are inclined to each other partly on account of the curvature of the neutral axis and partly because of the change of shear strain which means slightly different deviations from perpendicularity to the neutral axis.

Strain Proportionate to Distance from Neutral Axis.

But whatever their inclination, because of their strict similarity, the normal distance between them varies linearly with the vertical height measured from upper or lower surface or from the neutral axis. At the neutral axis this normal distance is the same as in the unstrained condition, the definition of the neutral axis being that there is no horizontal normal stress at it. Thus the horizontal longitudinal strain, that is, the horizontal geometrical extension or compression, increases in direct proportion to the distance down or up from the neutral axis. This is true for all stiff beams to an extremely close degree of approximation where there is no sudden change of section, and is true however much the modulus of elasticity may vary over the section. For instance, it is true of beams of homogeneous material for bendings far past the limit of elasticity, when the variation of stress across the section is not at all in direct proportion to the variation of strain. It is equally true for sections compounded of different materials with different moduli of elasticity, so long as actual slipping fracture does not take place causing the different layers to part company by finite sliding. To further illustrate its degree of truth, suppose that one spot or fibre in the section, in consequence of special softness or special hardness or special quality of any kind, shows a dimple or hollow in the originally flat cross-section; if this speciality be continued through the next very close section, a similar dimple will be produced in this next section, and this dimpling will not interfere with the truth of this law of proportionality between strain and distance from neutral axis.

This proportionality of the longitudinal strain to distance from neutral axis is the real foundation of beam theory. Coupled with Hook's law of constant proportion between strain and stress, it leads to the ordinary beam theory for homogeneous material.

Slipping of Rods.

In rationally built reinforced concrete every endeavour is made to prevent the steel rods, bars or wires from actually slipping in the concrete so as to allow shear fracture of the adhesive contact between them. As this is of essential importance to the shear strength of the beam, a passing criticism may be allowed on the means adopted to effect this object. It is evident that it is waste of the steel to effect this purpose by varying the section of the steel rod. The utility of the rod is limited to the strength of its smallest section; all the extra section outside this at

he shouldered parts is pure waste. Twisted rods avoid this waste; but if the twist were perfectly uniform, there being nothing but adhesive and frictional resistance to turning, the resistance to pulling through by screw motion is only slightly greater than that of a plain rod—greater only in proportion to the greater length of the screw-line to the straight axial length. Any slight deviation from uniformity of twist will have only a feeble influence in increasing the resistance to pulling through. If, therefore, twisted rods be used it cannot be too strongly recommended that the twist should be largely varied within quite short lengths. Evidently the best form would be alternate short plain and twisted lengths. Some special rods used in America would seem to be an excellent design provided the flattenings of the round rod be made short and deep enough. The design leaves, or is intended to leave, the section undiminished at the flattened parts, and it has the great merit of avoiding any very sudden change of sectional shape either in the steel rod or in the embedding concrete, a feature even more necessary in the concrete than in the steel for the avoidance of severe shear stresses at the corners between the changed sections. Any sectional shape of rod with indentations at short intervals rolled into its top and bottom surfaces in such manner as to maintain nearly uniform

area of cross-section ought to accomplish the desired object efficiently.

Position of Neutral Axis.

Efficient connection of this sort between steel and concrete being effected, it is evident that the stretch (or contraction) in the direction of the rod of the concrete lying close to the steel must be the same as that of the steel. It follows that the longitudinal stress per sq. in. in the steel is greater than that in the concrete close to it in the ratio of its greater modulus of elasticity. This ratio is usually called e . Taking the rod or rods as lying normal to the bending-moment section, the forces contributed by the steel to the bending moment are therefore those that would be contributed by concrete stressed equally with that closely surrounding the steel of an area equal to e times the steel area. Using, therefore, the device of considering the steel area e times as large as it actually is, and still placed at the same level, that is, broadened horizontally e times, there is no difficulty in calculating in the ordinary manner the position of the neutral axis, and from this the geometrical moment of inertia of the equivalent section supposed filled with concrete alone. This calculation gives t_m at each section for any given loading, and gives also τ , or, what is the same thing, τ , for each part of any section supposed as above expanded at the steel

parts and filled with concrete only. These are ordinary calculations, and there is no space in this article to detail them. They should offer no difficulty to any engineer trained to make structural stress-estimates.

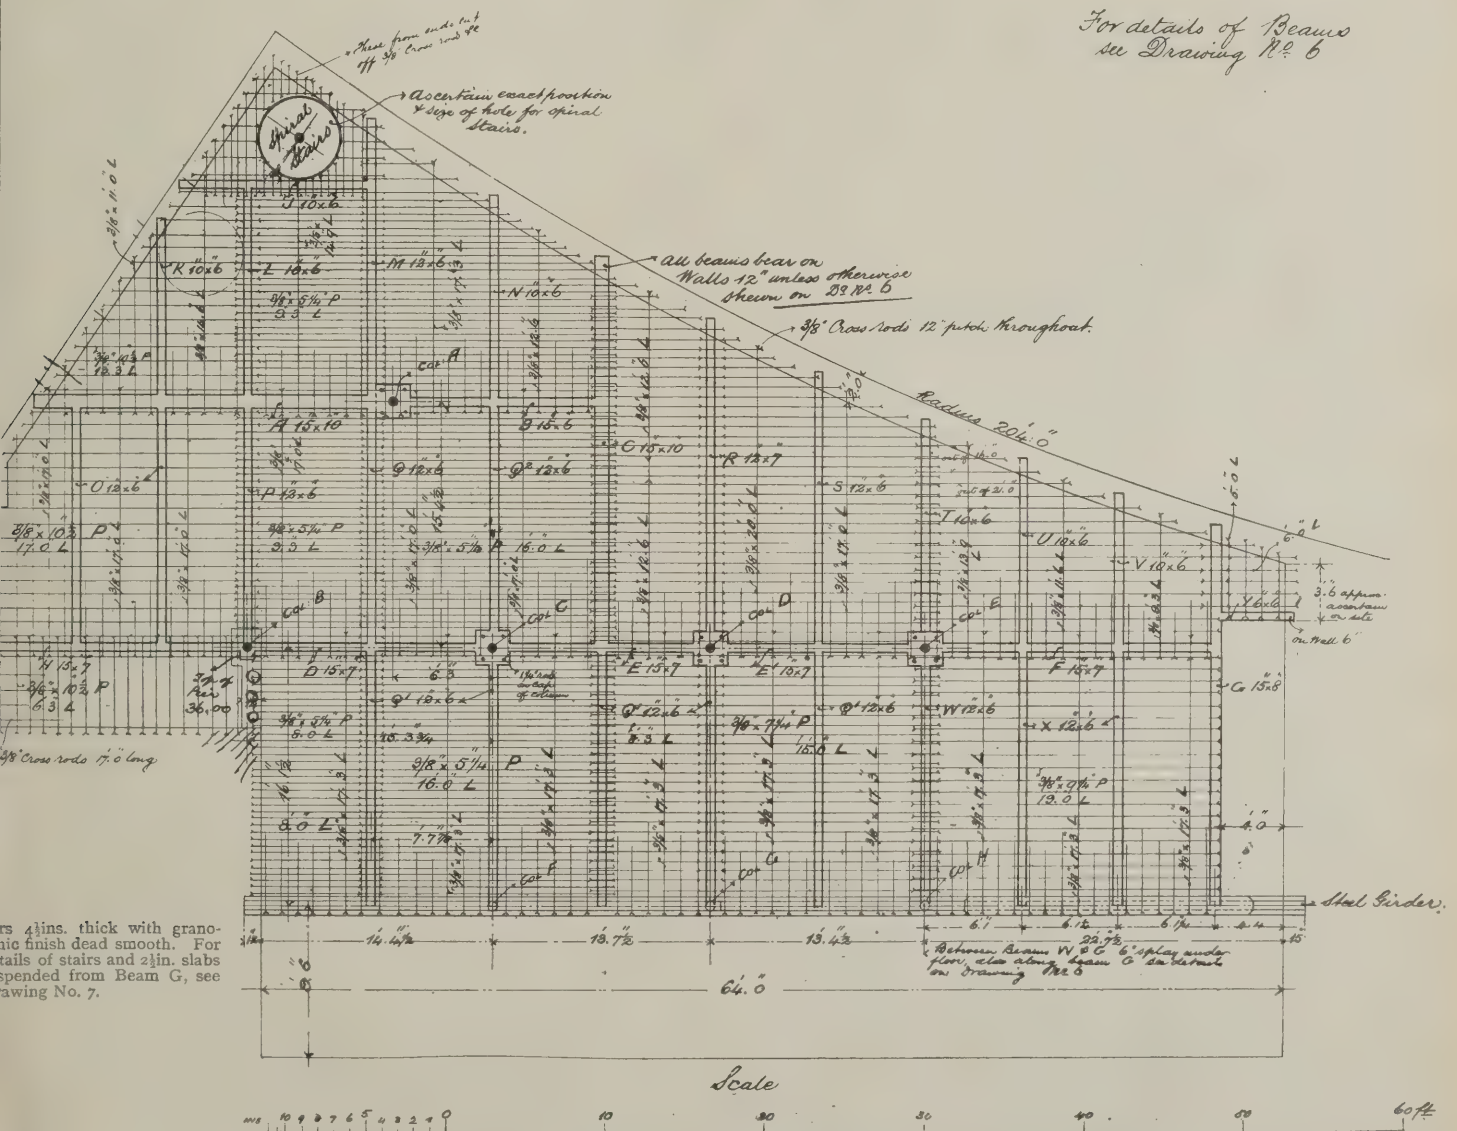

Supposing this done, the equation $S_v = \tau/h$ gives the means of finding the distribution of shear stress over this equivalent all-concrete section and the actual shear stress at each point of it. It now remains to interpret the results so obtained and convert them into measures of the actual stresses on the actual steel-concrete section.

As regards tensile stress over the vertical section, this interpretation is easy and simple. At every level in the concrete part of the actual section the tension is the same as in the equivalent section, and at every steel part of the actual section the tension is e times greater than in the concrete of the equivalent section at the same level.

It is not so simple, however, as regards the shear stresses. The completely accurate solution is beyond the limits of space remaining for this article, and the solution to be published must be looked upon only as a comparatively easy approximation.

[A correspondent has pointed out a slip made in the eighth line from foot of the last column in the first part of this article published on 23rd May, where the word "half" should be omitted. Also on the third line from foot of same column there is a misprint of 125 degs. for 135 degs.]

NOTES AND NEWS.

The Charing Cross Disaster.—Major Pringle in his report to the Board of Trade on the fall of part of the roof of Charing Cross Station on December 5th last says the evidence is conclusive on the cause of the accident. The snapping of a particular tie-rod was the immediate cause of all that followed. It is, he says, the first known case of a tie-bar in a contained arch breaking under a reasonable stress. He rejects the suggestion that reduction of strength by rust or corrosion, fatigue of material, wind-pressure, disturbance of foundations and absence of buttressing to the west wall were responsible for the disaster. He says "the fracture occurred at a weld, by reason of a flaw in the welding. This flaw, commencing in the heart of the bar, had gradually extended outwards. The additional weight of the temporary staging was the immediate cause of failure, but as the total stress in tension at the time of failure on the whole sectional area of the bar did not exceed 5.13 tons per sq. in., I find that, for the necessary purposes of repair, such a stress was not in any way unreasonable, and could not be anticipated to cause danger of failure. Lastly, I do not consider that any reasonable precautions were neglected by the engineer or his staff in charge of the roof, or that it was possible by any practicable method to have discovered the flaw in the tie-bar. The particular lessons to be learnt from this sad accident are as follows:—(1) That in old iron roofs of similar design, more especially where welded bars of any size have been used, there is danger to be guarded against of concealed flaws, which may grow in size under continued tensional stress, although in itself that stress may not be exceptional; (2) that unless additional security be afforded by the duplication or strengthening of the main tensional members there is possible risk of failure; (3) that where such risk of failure exists, it is necessary to consider whether the walls supporting the roof are in themselves sufficiently strong to resist the thrust which such failure would bring on them, and if not, to strengthen them."

Cement.—Before the London Section of the Society of Chemical Industry on June 11th Mr. Bertram Blount F.I.C., F.C.S., read a paper on "Cement," dealing chiefly with the manufacture and testing of Portland cement and giving some of the recent theories as to the chemistry of cement action. After pointing out the great extension in this industry which has taken place in the past twenty years, and showing by reference to tables that the cement manufacture has made giant strides in America, which was formerly one of our best customers and has now almost ceased to import English cements, Mr. Blount explained the changes in the method of manufacture, due to the use of rotary kilns and tube and ball mills. He stated that just as manufacturers were face to face with an enormous falling-off in their export trade, they were called upon to remodel their factories and to make changes in their plant which amounted almost to pulling out all the existing kilns and machinery and sending them to the scrap-heap. On the subject of the testing of cement, attention was directed to the standard specification and to the fact that the committee were about to meet during the present week to consider any necessary alterations, as this specification has met with opposition in certain quarters. On the important subject of cement action Mr. Blount stated it was tolerably certain that three silicates of calcium existed and four aluminates, and recent research tended to prove that certain solid solutions of these compounds were rearranged during the act of setting.

STRESSES IN REINFORCED CONCRETE BEAMS.—II.

(Continued from p. 5, No. 589.)

Rectangular Beams with Top Reinforcement.

THE following symbols are used in this article, in addition to others given in the previous article of the series:—

c = greatest stress in concrete in compression.

s = greatest stress in steel in compression.

τ = greatest stress in steel in tension.

a = area of steel in tension.

k = area of steel in compression.

In order to calculate the stresses in a rectangular concrete beam which is reinforced both top and bottom, we proceed in much the same way as we do for beams with a single reinforcement at the bottom, such as were dealt with in the previous article of this series in our first "Concrete and Steel" Supplement.

Fig. 7 shows in elevation and Fig. 8 in perspective the wedges the volumes of which represent the compressive and tensile stresses in the concrete and in the steel of a doubly reinforced beam. We shall neglect, as before, the value of the concrete in tension.

As explained in the first article, the strain is proportional to the distance from the neutral axis, and stress = $E \cdot$ strain. Consequently $C : S : T :: E_c \cdot \text{strain} : E_s \cdot \text{strain} : E_t \cdot \text{strain} :: E_c \cdot y : E_s \cdot (y - h) : E_t \cdot (d - y)$.

As the modulus of elasticity of steel is practically the same in compression as in tension, we will call both E_s . Therefore

$$\frac{C}{E_c \cdot y} = \frac{S}{E_s(y - h)} = \frac{T}{E_s(d - y)}$$

and

$$T = C \cdot \frac{E_s}{E_c} \cdot \frac{d - y}{y} \quad (11)$$

$$S = T \cdot \frac{y - h}{d - y} \quad (12)$$

or, by substitution,

$$S = C \cdot \frac{E_s}{E_c} \cdot \frac{y - h}{y} \quad (13)$$

From Fig. 8 we see that the total stress on the concrete in compression is represented by the contents of the shaded portion multiplied by the highest stress = $c \cdot \frac{by}{2}$.

As stated in the first article, the resultant of this stress in the concrete passes through the centre of gravity of the triangle, which is situated $\frac{2}{3}y$ distant from the neutral axis.

The stress in the steel in tension is $\tau \cdot a$, and the distance of the resultant R_t from the neutral axis is $d - y$.

The stress in the steel in compression is $s \cdot k$, and the distance of the resultant from the neutral axis is $y - h$.

It was explained in the first article that the resultant of several parallel forces was the algebraic sum of the moments of the forces, or $R = \Sigma w$, and that the moment of the resultant was the algebraic sum of the moments of the forces, or $Rl_r = \Sigma wl$, where l_r = the lever arm of the resultant. We can therefore substitute for R in equation (5) the sum of the compressive forces. We then obtain

$$c \cdot \frac{by}{2} + s \cdot k = T \cdot a \quad (14)$$

FIG. 7.

Also we can substitute the sum of the moments of the compressive forces for the moment of the resultant of the stress in the concrete in equations (6) and (7). We then obtain

$$M_r = c \cdot \frac{by}{2} \cdot \frac{2}{3}y + s \cdot k \cdot (y - h) + \tau \cdot a \cdot (d - y) \quad (15)$$

and by substituting (12)

$$M_r = c \cdot \frac{by}{2} \cdot \frac{2}{3}y + \tau \cdot k \cdot \frac{(y - h)^2}{d - y} + \tau \cdot a \cdot (d - y) \quad (16)$$

Substituting equations (11) and (13) in equation (14), we have—

$$c \cdot \frac{by}{2} + c \cdot \frac{E_s}{E_c} \cdot \frac{y - h}{y} \cdot k = c \cdot \frac{E_s}{E_c} \cdot \frac{d - y}{y} \cdot a$$

$$\therefore \frac{by^2}{2} + k \cdot \frac{E_s}{E_c} \cdot (y - h) = a \cdot \frac{E_s}{E_c} \cdot (d - y)$$

$$\therefore y^2 \frac{b}{2} + 2k \cdot \frac{E_s}{E_c} \cdot (y - h) = 2a \cdot \frac{E_s}{E_c} \cdot (d - y)$$

$$\therefore y^2 + 2y \cdot \frac{(k + a)}{b} \cdot \frac{E_s}{E_c} = 2 \cdot \frac{(kh + ad)}{b} \cdot \frac{E_s}{E_c}$$

The solution of this quadratic equation is

$$y = \frac{k + a}{b} \cdot \frac{E_s}{E_c} \cdot \left(\sqrt{\frac{2b(kh + ad)}{(k + a)^2} \cdot \frac{E_s}{E_c} + 1} - 1 \right) \quad (17)$$

It is obvious from equation (11) that if we fix the depth of the beam, give τ and c their full values, and know the value of $\frac{E_s}{E_c}$, then y

will be fixed without any regard to the ratio the areas of the two reinforcements may bear to each other.

Double reinforcements are not so economical of metal as a single reinforcement, and therefore we desire only to resort to them when the depth of the beam is fixed and the bending moment would cause the stress on the concrete to exceed its strength. To design a beam with double reinforcement we have the depth fixed therefore. Giving the full values to τ and c , we find y , i.e., the position of the neutral axis, by using equation (11). We now calculate the amount of tensile reinforcement that will develop the full strength of the concrete and see what is the moment of resistance by the methods given in our first article. We know the bending moment the load induces and the excess of this over the moment of resistance thus determined has to be resisted by adding metal in compression and more metal in tension. It has been previously explained that the moment of resistance is equal to the tensile force multiplied by the distance of its line of action from the line of action of the compressive force. We therefore make $\tau' \cdot a' \cdot (d - h) =$ the excess of bending moment, where τ' is the stress in the added amount of steel below (limited to 60,000 lbs. per sq. in.), and a' its area. The area k we then find from equation (16). There should be at least rin. of concrete covering the steel, so that we have h fixed.

(To be continued.)

FIG. 8.

STEEL IN SPECIFICATIONS.

Some Avoidable "Extras."

By R. H. Jackson.

THE ubiquitous extra, like the poor, is always with us. It is not a thing of modern growth. Pericles suffered the severe censure of his fellow-citizens throughout the progress of his buildings by reason of an artistic disregard for the limits of the Athenian purse.

History has not recorded that it flourished in Egypt, but perhaps if the literature of one Rameses had been saved to us we might have traced its malevolent influence even in that happy land.

However, be it in Bubastes or in Battersea, it is a sordid and inevitable reality, and any items of information which tend to keep extras within reasonable bounds are well worth noting.

In the consistent advance in the use of steel in modern buildings a little lack of discrimination in the selection of steel shapes often entails an accumulation of extras which are quite unproductive of any enhanced value in the materials supplied.

Rolled steel is, without doubt, the most extensively used class of iron in architectural work to-day. By rolled steel we refer to all the shapes or "sections" which emanate

from the rolling mill. Before the use of steel had reached its present pitch, such sections as the joist or H-section were made by welding the flanges to the intermediate member, or "web." Even now specifications frequently make mention of the fact that the "welding must be thoroughly and securely carried out." If this stipulation were taken literally by the manufacturer the cost of producing such an article would be at least double that of the joist in everyday use.

Speaking broadly, the following are the sections which are *sine qua non* in the building of to-day:—Joists, channels, angles, tees. Plates should also be included in the list in view of their various uses in building work, chief amongst which is their presence in the compound girder.

The rolled steel joist takes perhaps the first place in point of demand, and without going into the technicalities of the processes of manufacture and rolling, or the peculiarities which rule in the control of prices, it would be well to point out one or two little things which appreciably affect the bill of costs.

Frequently, in order that his mind may be at ease as regards the quality of steel which is going to be used, the architect refers to some old-established textbook, and culls therefrom an analysis of the chemical com-

position and other properties of an ideal metal. The specification is doubtless a very excellent one, and one which might leave the author easy in mind that he has covered his followers against every possible contingency which can arise.

This elaborate specification, however, may represent a class of product which can only be supplied at considerable increase of cost on the part of the manufacturers, besides incurring heavy delay in delivery. Needless to say, the manufacturers do not undertake an exceptional specification without making thoroughly well sure that they are not going to lose on the transaction. As a consequence, a high figure is often the result without any material advantage being gained on the part of the consumer.

Briefly, the ordinary steel of commerce is quite sufficient in quality for ordinary building purposes, and any stipulation as to tests, &c., is in the vast majority of cases superfluous.

A first-class merchant to-day (and there are a few) can frequently give a very valuable hint as to the best specification of steel for a particular purpose, keeping well in view both the question of economy and that of efficiency. He knows the capabilities of his works, and how they are situated as regards turning out any particular class of article promptly and successfully.

STEELWORK AT WARING AND GILLLOW'S NEW BUILDING, OXFORD STREET, LONDON. R. FRANK ATKINSON, F.R.I.B.A., ARCHITECT. RICHARD MORELAND AND SON, LTD., ENGINEERS.

The great feature in the steelwork at Messrs. Waring's new building in Oxford Street is that the steel frame is quite independent of the walls, stanchions having been carried up from the basement, and girders put across. All the galleries are free from obstruction by columns. Altogether 3,000 tons of steel were used. The above view (from a photograph by Messrs. Martin and Sander) shows the work in course of erection. In the foreground will be noticed the top of the rotunda, with its inner and outer shell.

The point the buyer should emphasize is the type of steel he is aiming at as regards tenacity, &c., and the particular purpose, if it be an exceptional purpose, for which the material is required. A merchant possessed of experience and technical knowledge will then see that the instructions are communicated to the works in such terms as to ensure the right thing being sent forward without prohibitive cost or delay.

Exceptional lengths should also be avoided, as they only incur extra risks in rolling, and consequently extra cost as well as in some cases an expenditure in freight which is quite out of proportion to the value of the bar. Quite frequently long girders are seen in specifications, which might have been specified in two pieces without detriment to the structure for which they were intended.

In all the sections which we have mentioned, joists, channels, angles, tees, or special sections such as broad flange beams, much extra cost, delay in delivery, and alteration to designs might be avoided by specifying only the listed sizes and standard weights.

The standardized dimensions of the British Engineering Standards Committee are a very safe guide as to what is readily and economically available.

Joists and channels, for instance, can of course be rolled with thicker webs (and consequently greater weight per foot) than those shown in the listed dimensions, but it should never be taken for granted that this can be done without extra cost or delay in delivery. It is only reasonable to expect that anything out of the ordinary run of a manufacturer's practice takes a second place to the article that is in regular demand.

We have seen text-books of very recent issue containing tables of rolled steel joists which include sections which have never been rolled for the last ten or fifteen years, and for which probably no rolls are at present in existence. These sections could, of course, be supplied, but at some slight inconvenience: something like six months would be required for their delivery, and for a small lot the extra would amount to a modest trifle of about £100 per ton!

Doubtless many of the points we have mentioned are within the cognizance of the majority of architects and draughtsmen, but they are all liable at times to be overlooked.

REINFORCED CONCRETE SYSTEMS.

II.—The Hennebique System.

THE Hennebique system of reinforced concrete construction was one of the earliest to be adopted in this country on a large scale, and we therefore devote the second article of this series to a description of it. The system was invented in 1892 by M. François Hennebique, a Belgian engineer, of Brussels, his patent dating from the same year. M. Hennebique is said, however, to have constructed floors of reinforced concrete in 1879. An important feature of the system introduced in 1892 was the adoption of the reinforced concrete beam.

The extensive adoption of reinforced concrete on the Continent and in this country is undoubtedly due in great part to the initiative of M. Hennebique. His system was from the first in a practical form, and he established by means of tests and theoretical investigation a basis of calculation for structural members which enabled structures of large size and suited to all sorts of engineering and architectural conditions to be economically and safely designed. The essentials of the system are to be found in the beam construction. Fig. 1 shows a longitudinal section of a Hennebique beam. It will be observed upon examination that the beams are continuous over supports, that some of the rods are inclined upwards towards the supports at the points of contraflexure, and that the beam is reinforced vertically by means of stirrups or hangers. Fig. 2 gives a detail of the inclined rods and stirrups at point of contraflexure, and also the connection between beam and pillar.

The Crux of the System.

The stirrups are the crux of the system. They reinforce the beam against shear and enable beams to be constructed of great span. The stirrups are placed closer together towards the supports where the shear is greatest. The shear of course is not so material a part of the problem in the design of a beam required to sustain a concentrated load only; it becomes, however, of vital importance when distributed loads are carried, as always occur in buildings.

The extension of the rods over the points of juncture of the supports and beams re-

inforces the concrete to take care of the reverse bending moment. The top rods over the beams serve another purpose also. The beams are calculated as T-shaped and not rectangular. This enables local loads to be transmitted directly to the beams and not through the floor slabs, so avoiding the compressive stress in the concrete being greatly increased due to its action at one end and the same time as a floor slab and as a flange to the beam.

Floor Slabs.

Fig. 3 shows a cross-section through the beams, and illustrates the form of reinforcement for the floor slabs. It will be seen that while some rods run straight across, others are cranked up until near the top of the beam and stirrups inserted near the junction of the floor slab with the beam. The stirrups in the small spans of the slabs do not need to be carried the whole way, as the shear is small and can be safely resisted by the concrete alone.

It may here be stated that in both beams and slabs only every other rod is inclined or cranked up. In the beams both straight and cranked bars come close together. In slabs they are separated some distance apart. The cranked rods also take part of the shear.

Double or hollow floors have been used in America with this system where it has been thought desirable to hide the beams.

It will be gathered from the foregoing that the system, so simple in its elements, effectually and economically takes care of all the stresses which are induced in a complicated structure. For very large spans it is obvious that the arch is more economical than the beam. We need not, however, detail the arch reinforcement, as it is very similar to plain beams.

In Fig. 4 we illustrate another part of the system, namely, the reinforcement of pillars or columns. This consist, as shown, of four vertical rods tied together at intervals by wire loops.

Foundations are also constructed in the Hennebique system of reinforced concrete, and Fig. 5 shows a typical foundation to a pillar.

Walls are constructed in the Hennebique system by placing rods vertically and horizontally. As regards the former, one series is on the outer face, and another is on the inner side, stirrups tying each set to the opposite face. The longitudinal rods are placed in the centre of the wall.

Roofs have also been constructed to a considerable extent in Hennebique ferro-concrete, both in this country and abroad. The usual form is a flat roof, but barrel roofs have also been built.

Staircases are another adaption, the reinforcement being similarly arranged to that in beams—that is to say, each flight is supported at head and foot by beams, and rods run between close to the underside of the stairs, whilst towards the point of support some of the rods are inclined upwards as in the beams. Stirrups are placed perpendicular to the soffit, extending to front edges of treads.

We publish views showing work in course of construction on this system. Fig. 5 shows a view of a cold storage warehouse at Southampton in this way. The pillars on the ground floor are clearly shown, and also the moulds or forms which were used for their erection. Long boards are placed on three sides, the concrete is then filled in layers, held in place on the fourth side by a short piece of board, and tamped down with iron rammers. Another piece of board is next placed in position, and the concrete raised to this further height. The work is continued in this manner until the pillar is completed. Centerings in the shape of long boxes are now placed between the pillars, the reinforcement for the beams laid therein, and the concrete rammed in as before. Fig. 6 shows the construction of a floor. The longitudinal

FIG. 1.—LONGITUDINAL SECTION OF HENNEBIQUE BEAM.

FIG. 2.—DETAIL OF INCLINED RODS AND STIRRUPS AT SUPPORTS.

FIG. 3.—CROSS-SECTION THROUGH BEAM SHOWING REINFORCEMENT OF FLOOR SLABS.

rods and stirrups are clearly shown with the concrete partly filled in. This floor is, however, of the same depth throughout, and does not show the beams below the floor sustaining the floor slabs above. This particular view has an additional interest, because it illustrates the reconstruction of the floor over the Queen's bedroom at Sandringham after the fire which occurred in 1903 in connection with a fireplace of the sunken hearth type, which our readers will no doubt remember.

The Hennebique system has been used for many interesting buildings and engineering structures. We may particularly note cantilever work in which several floors have been supported over dock walls, railway sidings or sidewalks, and theatre galleries. Retaining walls, water towers, reservoirs, bridges, aqueducts, piles and pipes are now every-day adaptations of the system of M. Hennebique. In regard to bridges many tests have been carried out in France and in this country upon Hennebique constructions, and it has been shown that not only is there very great economy both in first cost and in upkeep, but that there is very little vibration, whereas with steel bridges it is considerable.

We illustrate in Fig. 7 the piles patented by Mr. L. G. Mouchel, the concessionaire of the Hennebique patents in this country, whose address is 38, Victoria Street, Westminster. The longitudinal rods are bound round with wire. It will be seen that the Hennebique pile is practically a pillar with a hollow centre. The hollow diaphragms are inserted for the purpose of saving weight, which in the case of a solid pile would be very considerable. The particular piles illustrated are 18ins. by 18ins. and 48ft. long.

Here may be mentioned an advantage which a reinforced concrete pile has that is sometimes not remembered, but which the Hennebique constructors have had to resort to, namely, that during the process of driving the pile may be easily lengthened if this should be desired. The piles are either driven by an ordinary pile driver, an iron cap being put on the head to prevent shattering under the blow, or sometimes a jet is passed down the centre of the pile through the point of the shoe, and water forced out so as to cause the pile to sink under its own weight or a light blow. A great deal of pile construction has been done on the Hennebique system in the foundations of buildings, piers and jetties in this country.

In view of the enormous number of buildings which have been constructed on the Hennebique system in France, Germany and America, it is obviously impossible for us to draw up an adequate list of even the most important buildings. We can only note that several structures built by M. Hennebique were prominent feature at the last international exhibition at Paris, since which date the system has made enormous strides in France and Germany.

We give a short list of some of the most important buildings which have been erected in this country on the Hennebique system under the general supervision of Mr. L. G. Mouchel. It may also be mentioned that there are a number of contractors who have secured licences for the system from Mr. Mouchel and practise in various parts of the country. Messrs. Holloway Brothers, Ltd., are one of the London contractors for the system.

List of some of the Buildings on the Hennebique System.

- G.W.R. warehouse at Nag's Head, Borough, London, S.E.
- Grain silos at Swansea, for Weaver & Co., Ltd.
- Co-operative Wholesale Society's warehouse, Newcastle-on-Tyne.
- Flour mill and grain silos, Victoria Dock, London, for W. Vernon & Sons.
- Cold stores at Southampton.
- G.W.R. goods station and warehouse, Canon's Marsh Bristol.
- G.W.R. grain warehouse, Plymouth Docks.
- Transit sheds, Manchester Ship Canal.
- N.E.R. goods station, Newcastle-on-Tyne.
- Electric car sheds, Bournemouth.
- Old Foundry, Hull.
- G.W.R. warehouse, Royal Albert Docks, London.
- Hudson & Kearn's printing works, London.
- Premises for C. C. Röder, Ltd., Acton.
- Whitbread & Co.'s beer stores, Willesden, and brewery, Chiswell Street, London, E.C.
- Hampton & Sons' repository, Battersea.
- Pogson's spinning mill, Slaithwaite.
- Drill Hall, Chatham.
- G.W.R. warehouse, Brentford.

As a natural consequence of the use of ferro-concrete for so many buildings where fire-resisting construction is desired in view of excessive risks, a number of fires have taken place which have proved the remarkable resistance which the construction has. In no instance has a failure been known. In many cases the Hennebique construction has prevented the fire spreading beyond the compartment in which it originated, while in buildings where only a part has been Hennebique construction, this part has, in many cases, saved a great portion of the building from total destruction, forming a fire stop more effectual than the work of any fire-brigade.

A National Collection. WE have heard it said, though we cannot vouch for the truth of it, that a more complete record of our old buildings is to be found with certain institutions in America and in Germany than in this country; but whether or no that is an actual fact, or one of those statements that pass current without anyone being able to check them, or having sufficient energy to do so, it certainly is true that we possess no proper collection of the multitudinous drawings that have been made of our old examples of architecture. For any individual in an unofficial way to attempt such a collection would seem from the start to be futile. The matter is a national one, and we are therefore glad to receive a communication from Mr. W. R. Lethaby and Mr. R. Weir Schultz, on behalf of a committee that has been formed, to

the effect that such a collection of drawings of architecture is at last proposed to be initiated. The committee point out that owing to the lack of any organized scheme, numerous sets of measured drawings of old buildings forming in themselves valuable historical records have been lost or destroyed, and many others are practically inaccessible to students. "Magnificent work has been done during the last fifty years by young architects and others, in making accurate drawings of old buildings both at home and abroad, and as many of these buildings have since been destroyed or materially altered, these drawings in some cases form the only record of their original design and arrangement. It has long been felt that drawings of this nature should be carefully collected and housed for future reference, and the committee charged with arranging a testimonial to Mr. Phené Spiers last year hoped to have been able to initiate such a scheme as part of the testimonial. This was found to be impracticable, but Mr. Spiers has since come forward, and of his own free will put aside the money balance of the testimonial as the nucleus of a fund for dealing with the matter, and he has invited a small committee to assist him in organizing and arranging a scheme." The authorities of the Victoria and Albert Museum were approached on the matter, and it is satisfactory to hear that arrangements have now been completed whereby the collection will be deposited in the Art Library at South Kensington, where the drawings will be accessible to students for purposes of study. The collection will not be confined to drawings of old work, but will include records of important public buildings and of works by eminent architects down to the end of the nineteenth century, photographs of buildings which no longer exist, or which have been materially altered, and sketch-books of deceased architects of repute. The need for such a collection has long been recognized, and it is satisfactory to know that a definite scheme has now been formulated. The committee are to be congratulated on their initiative. All they now need is the support of architects who can aid them by presenting drawings suitable to be included in this most important collection.

Congress Exhibitions. In connection with the International Congress of Architects which is to be held from July 16th to 21st several exhibitions will be held. Two of these are of considerable interest. The bare announcements that have previously appeared of these two exhibitions do not give any idea of their importance. Our remarks apply more particularly to the chronological exhibition of British architecture from the Norman Conquest, 1066, to the death of Sir Charles Barry in 1860. This exhibition has been placed in the hands of several of the foremost authorities on the

history of the various periods of architecture in this country, who are selecting the photographs by which the examples of architecture will be illustrated. The first section (Norman and Early English work) is in the hands of Mr. Francis Bond and Mr. W. J. N. Millard, who will collect together all the earliest examples of Norman, Romanesque and Gothic work. The second section on Gothic work (Domestic and Perpendicular) is in charge of Mr. C. Harrison Townsend and Mr. W. A. Forsyth, and these four gentlemen also have the benefit of Mr. E. S. Prior's assistance. The later periods, namely, the Early and Later Renaissance, will be supervised by Mr. J. A. Gotch and Mr. Mervyn Macartney respectively. Many of the photographs, we learn, have never before been exhibited, and some have been specially taken. Every building of note belonging to each particular style will not of course be illustrated by photographs, only the more important ones. In addition to the photographs there will also be shown models and drawings by deceased architects. For instance, the model of Wren's first design for St. Paul's Cathedral has been specially lent by the cathedral authorities. The Institute, too, possesses several interesting models and original drawings. It is obvious that such an exhibition will not only illustrate the course of this country's architectural history in a form superior to that to be found elsewhere, but it will be the first time that such an exhibition has been attempted. Moreover, it will trace our architectural history right up to the doors of the present. We are, of course, too close to give an adequate review of present-day work, but the Congress will not be debarred from some glimpse even of this, because the second exhibition, referred to above, is to be of photographs of buildings executed by living British architects. These are selected men, but the selection is a wide one; it goes beyond the bounds of the membership of the Institute, and includes all the best-known men both inside and outside the Institute. There is also to be a collection of oil paintings and water-colour drawings of English architecture. These will supplement the other exhibitions. The idea is a distinctly happy one, and we shall look forward to these exhibitions with the greatest interest. Whoever has been responsible for the idea is deserving of all praise. It is only to be regretted that the exhibition is not likely to form a permanent feature of an architectural museum. We should like to see this collection included with those of the plaster casts in the Royal Architectural Museum in Tufton Street, though this is impossible at present owing to want of room. Failing its inclusion among the exhibits of this museum we should like to see it housed in the Royal Victoria and Albert Museum at South Kensington.

S.K. EXAMINATIONS IN BUILDING CONSTRUCTION.—STAGE III.

[Not more than six questions to be answered, of which one only to be selected from each of the first two divisions: the tracing question 52 to be attempted by all candidates. The maximum number of marks attainable for each question is given in brackets. Time of examination, four hours.]

Division I.

41. Describe fully the tests which you would apply on the job to ascertain the quality of a sample of Portland cement submitted to you.

(50)

The usual and effective tests for Portland cement take time. They should be applied to quantities of cement delivered or to be delivered; tests on the job have more to do with the results of storage to discover whether the cement has been fairly treated in the store.

The workmen's test: Dip the bare arm into the opened bag; if the cement feels cold it should be rejected; such cement has been exposed to a damp atmosphere; the particles may in such circumstances have separately set and the cement has lost its active properties. If the cement feels warm it has not been sufficiently air-slaked; such cement will swell in the work.

Colour: An experienced workman accustomed to a particular make of cement will be able to judge it by its colour.

There should be no lumps of set cement in the mass. Sometimes lumps resulting from careless storage are bruised, and the cement refilled into the bags; a handful being taken, the grittiness of such cement is felt.

Many well-known makers have lead seals on the bags, which in some degree are a protection. A small glass phial may be filled with wetted cement: on setting, if the cement is "hot" it will burst the bottle; if underburnt or if dead it will shrink in the bottle, but this part of the test takes time. The cement may be tested on the job for quick or slow setting.

For fineness it may be tested on a standard sieve. If there is a reasonably accurate beam and scales on the job the weight of a measured quantity may be tried.

42. Compare the relative advantages of (a) marble, (b) concrete and iron, and (c) solid teak for a staircase from the point of view of resistance to fire. Give your reasons fully.

(50)

(a) Marble withstands fire badly, a hot fire burning it to lime. Any kind of stone when heated breaks up if water is thrown on to it, owing to irregular contraction.

(b) Concrete, when heated, will also break up if cold water is thrown upon it, but possibly it is safer than a very compact stone. Iron embedded in concrete is protected from the heat by the comparatively non-conducting concrete, and in many cases it will retain its strength and prevent the concrete falling to pieces.

(c) Teak, being a better non-conductor than stone or concrete, will not fail by breaking up when water is dashed upon it; it will fail by burning through, and as this takes time it may be safer when used solid in the steps of a staircase than stone or concrete and iron. The whole question is comparative.

All three substances will be destroyed in the ordinary circumstances of accidental fire. It is probable that where iron is depended upon for strength, and the iron is protected from heat by non-conducting cement-plaster on expanded metal or otherwise, there is found the best means of resisting complete destruction by fire. We believe the late Captain Shaw was in favour of wooden beams and pillars coated with common plaster. The obvious objection to wood is that it is a fuel, and when its protection is destroyed it adds its bulk to the general burning.

43. Describe the methods in practical use for preserving timber from the effects of moisture. Classify oak, elm and fir as to their suitability for use in (a) moist ground, (b) ground alternately moist and dry, and (c) dry soil.

(12)

Most timber bears moisture well if continuously immersed in water; it is the alternations of wetting and drying, or circumstances of position, which allow the action of animal or vegetable life (minute organisms) that require to be guarded against or provided for. Painting is the most obvious preservative. By this means the timber is shut off from contact with organic germs, and by preventing the penetration of wet is preserved from alternations. Timber is preserved by having its interstices filled with antiseptic substances, which may also be of an oily nature, repelling damp. Creosote is a usual substance employed. The timber is first subjected to a rarified atmosphere to draw out the moisture, and then the creosote is admitted and forced into the wood by pressure (pumped into the containing vessel).

(a) All three will keep well in continuously moist ground. The Irish bog oak and bog fir from prehistoric forests are at the present day put into work (the bog fir is particularly fresh and resembles pitch-pine in work). It was formerly supposed to be an advantage that coffins should not quickly decay, and elm was much employed for them.

(b) Our experience with oak is that when alternating from wet to dry it tends to foliate in the planes of medullary rays, thus admitting deleterious influences to its mass. It is usual to put oak sills to window frames. For this purpose straight-grained foreign oak is not the best; in any case care should be taken that the edges of medullary rays are not exposed to the weather. (The answer expected to this question is probably oak; but if wet and dry means unprotected by paint or otherwise, no timber can be recommended as suitable.)

(c) Oak and any timber is fairly suitable in very dry soil if it has been safely seasoned beforehand.

Division II.

44. The diagram represents, in outline only, a steel truss for a north light roof. Draw to a scale of $\frac{1}{8}$ (4 ft. to an inch) a suitable truss, and construct the stress diagram for a vertical load of $\frac{1}{2}$ cwt. per ft. super. to a scale of 20 cwt. to an inch. Draw one-quarter full size the detail of joint at foot of north side. The trusses are supposed to be 8 ft. apart.

(60)

See drawings. Alternative details are shown of the joint at foot of north side. The stress diagram has been drawn on the assumption of a load of $\frac{1}{2}$ cwt. per ft. over the whole of the roof. This, while reasonable for the

purposes of the question, is much in excess of an actual load for the north side.

45. A beam 20 ft. clear span is subject to a distributed load of 10 tons combined with a central load of 5 tons: draw the bending moment diagram and the shear stress diagram: scales, 4 ft. to 1 in., 20 ton-feet to an inch, and 10 tons to an inch. What is the value of the bending moment in the centre and the reaction at each end?

(60)

See drawing. Bending moment diagram is shown by full line over A B, while dotted lines *l* and *k* indicate bending moments for distributed load and concentrated load respectively. Shear-stress diagram shown below

A B, *m* indicating shear diagram for concentrated load. Bending moment at centre = $\frac{WL}{8} + \frac{WL}{4} = 25 + 25 = 50$ ton-ft. Reaction at each end, 7.5 tons.

46. A compound girder, composed of two rolled steel joists placed side by side, with one 12 in. by $\frac{3}{4}$ in. top plate riveted on, carries in the centre of its span, which is 16 ft. clear, a steel stanchion, the weight of which, with its superincumbent load, is 35 tons. Calculate the scantling of the joists, and sketch the base of the stanchion and its connection with the girder.

(60)

Bending moment = moment of resistance = 1,680 ton-ins. Let *d* = depth of girder in inches. Assume thickness of joist flanges to be 1 in. and safe load 6 tons per sq. in. Then area of compound top flange = 18 sq. ins., area of bottom flanges = 12 sq. ins., and height of neutral axis from bottom flange = $\frac{1}{3}d$. $\therefore 1680 = 12 \times \frac{1}{3}d + 18 \times \frac{2}{3}d \times 6$

$= \frac{1680}{2} = 12 \times \frac{2}{3}d \times 6$

$\therefore d = \frac{1680 \times 5}{2 \times 216} = 19'4$ ins., say, *d* = 20 ins.

In this calculation we give no credit to the web for resisting bending moment, but we have also taken no account of the weight of the beam, nor of the distributing effect of the base of the stanchion, and we take a lower safe load per square inch than is some-

times taken. We should make the web 6 ins. thick.

We are here led to a size of joist which is different from any stock section we have seen; the nearest to it, of Dorman and Long's, is 18 ins. by 7 ins. by 75 lbs. per foot, but the 7 in. flange would be unsuitable to combine with the 12 in. wide plate proposed. The covering-plate should indeed be somewhat wider than the sum of the flanges.

Having arrived at the dimensions in the manner shown, and having obtained the weight of the girder itself, more careful calculations may be made by the exact

Q 46.

student, using the moment of inertia; but having regard to all the circumstances it is fair enough to act on the values here determined; they will be found to be full on the side of safety. For the attachment of the stanchion we should propose to rivet the brackets on to the joists together with the plate, and bolt the brackets to the stanchion. To bolt the brackets on to the joists would result in decrease of strength, as the bolts would not tightly fill the holes. See sketch.

Division III.

47. How does a mason's scaffold differ from a bricklayer's scaffold? Sketch the end view of a mason's scaffold, about 30 ft. high, to a scale of $\frac{1}{4}$ in. to an inch; name the parts and mark the scantlings. What is the particular advantage of bracing in scaffolding?

(50)

Q 47.

A.

A mason's scaffold has an extra frame of standards and ledgers, placed as near to the face of the wall as practicable, to receive the inner ends of the putlogs, by which means holes in the wall are avoided. It is also made stronger than a bricklayer's scaffold; the standards are placed closer together and the whole more firmly braced. Bracing binds the scaffold together and secures it against rocking, and adds generally to its strength by stiffening the standards and ledgers. See sketch.

The above is a fair short book answer, and it is what is probably expected. We have seen, however, masons' scaffolds which might have been bricklayers' scaffolds. The answer only applies to coursed ashlar; in sneaked work holes may be left for putlogs. Book information on scaffolding should be modified by the increased use now being made of steam derricks with long jibs for setting stones, by which the weight of heavy stones never comes upon the scaffold. A single pole is shown for each standard, as they can be obtained long enough for the height of scaffold given; for any higher scaffold two poles would be required, lashed together. In some cases masons' scaffolds are made of squared scantlings fastened with bolts or coach screws. The above scaffolds are termed "independent," not being directly connected with the wall.

48. Describe clearly, illustrating your answers by sketches, the "cylinder" and "tank" systems of hot-water circulation, and state the relative advantages and drawbacks of each system.

(50)

The cylinder system is shown by sketch A, the tank system by sketch B. In the cylinder system the hot-water storage tank—the cylinder—is fixed at a comparatively low level and below the rising pipes. A flow-and-return are fixed between boiler and cylinder as shown. It is important to have no connections to these pipes by which the cylinder may be emptied. A rising flow pipe is connected to the top of the cylinder the upper end of which is turned over the cold-supply cistern or carried through the roof; this forms a steam exhaust as well as the "flow" from which hot-water supplies are taken. It is advisable to have a return to this and to all subsidiary flows as far as possible by which all "dead" water in pipes is avoided. It is an improvement to connect the cold water supply direct to the bottom of the boiler, instead of to the bottom of the cylinder as shown.

It is also useful to have an emptying cock to the cylinder, but it should have a loose

B.

spanner to prevent the cock being used except for cleaning and repairs. A safety valve is advisable in each system.

In the tank system the hot-water storage cistern is placed above the rising pipes, and all supplies are taken off the flow beneath the cistern, with or without returns connecting to the main return from cistern to boiler. The storage tank, being subjected to but little pressure, is usually rectangular, while the cylinder, being fixed at a lower level and subject to greater pressure, is made in that shape for the better resistance of the pressure.

Sometimes the small "feed" cistern is omitted. The principal advantages of the cylinder system are—(a) Circulation will continue if water-supply temporarily fails; (b) hot water can be obtained quicker and at a higher temperature; (c) the hottest water is drawn before the temperature is lowered; (d) the cylinder can often be utilized to air a linen closet.

The drawbacks are—(a) The supply cistern is more exposed to the action of frost, having no heat near it. (b) The cylinder, if too light, is liable to collapse by the generation of steam when hot-water is drawn and cold suddenly introduced. These drawbacks can easily be avoided or minimized.

The advantages of the tank system are few and unimportant.

The hot-water tank can be placed near to the cold-supply cistern to prevent frost, and a possible small advantage in some cases may be gained by placing the hot-water tank in the roof when no other convenient place is available.

Some of the drawback are—(a) The hot-water tank may be emptied by failure of the water-supply, involving risk of injury to boiler, if not a worse consequence. (b) When hot water is drawn off the cold water from "feed" mixes with the hot water in the tank and rapidly cools (this may to some extent be obviated by connecting cold supply to the return at some distance from the tank). (c) The tank, being usually placed at a considerable distance from the boiler, there is loss of heat by radiation from flow-and-return pipes, and there is often further loss from the tank itself.

49. An 18 in. brick wall, with the usual footings and concrete, is to be underpinned to a depth of 6 ft. Describe fully how this should be done, and draw an elevation and section of the first portion of the completed work to a scale of $\frac{1}{4}$ in. to an inch showing the old footings by dotted lines.

(50)

The method of dealing with this would

depend greatly upon the particular circumstances connected with the work; e.g., weight of and kind of loading on the wall, nature of soil, adjacent property, purpose for which the underpinning was done, &c. Underpinning work is done (usually) in short sections. One or more stout "needles" would be placed across under the wall, firmly packed and supported by a vertical or slightly raking "shore" at each end (holes large enough being excavated to allow of a good spreading base at a sufficiently low level), and the whole tightly wedged with hardwood wedges before any considerable amount of excavation was done. In some cases the upright shore can be dispensed with and a running baulk, placed on the ground parallel to wall, substituted to receive one end of the needle. When the shoring is tight and secure the excavation can be proceeded with, and the old footing and concrete removed for the section to be dealt with. (Shoring to the sides of excavation to be done as the nature of the soil requires.) Raking shores to the upper part of the wall may be required in certain cases. The new base should be put in of good concrete solidified by running (not too wet) and the brickwork brought up in cement-mortar and well wedged up to the old work. The ends of the completed section would be left for bonding with the following sections, and the kind of bond would depend upon whether the work was to be exposed, and the appearance desired. The shores should be left standing until the mortar is thoroughly set and hard. See drawing.

As a matter of fact, shoring for underpinning is often done in a much simpler manner than the above; sometimes considerable risk is run by contractors, partly to avoid expense, but sometimes for want of understanding, or neglecting to calculate the loading on the wall, or other circumstances connected with the work.

Q. 50. Draw to a scale of $\frac{1}{4}$ in. to an inch a "Belfast" roof truss for 40ft. span with a rise of 6ft., with detail of joints one-eighth full size = $1\frac{1}{8}$ ins. to a foot. (50)

See drawings. This question could only be answered by candidates who have heard the name "Belfast" applied to this class of

Q. 50.

Q. 51.

SECTION.

ELEVATION.

Q. 49.

roof truss. This name is not general even in Ireland.

51. A billiard-room is to be covered with a lead flat having a lantern light 12ft. by 6ft. clear internal dimensions. Draw to a scale of $\frac{1}{2}$ in. to a foot a cross-section through the lantern showing 12ins. of lead flat on each side, with the trimmers and joists. Describe the precautions which you would take to prevent condensed water falling on the table. (50)

See drawing. This is only one of a number of possible designs, both as regards construction and appearance, no restrictions being imposed in reference to the lantern itself, apart from the dimensions; it might be constructed in a light manner of steel. We have given only a half cross-section instead of a full one, as evidently intended, seeing that 12ins. of the lead flat was to be

shown on each side. Surely there is work enough in a half-section.

52. Trace neatly in ink the drawing, Fig. 52. The lines should be firm and unbroken and should finish exactly at the proper points.

Q 52.

[This paper is not so open to criticism as the preceding papers; there is, however, not sufficient variety of subjects, and most of the questions require more time than is available at the examination to properly answer them. The last question, being a compulsory one, would be a serious matter for artizans, and even for most architectural students. Half of the doorway would be drawing enough, and would fully test the candidate's qualifications. As the tracing must (properly so) be in ink, time is required for the ink to dry, as well as to do the tracing.]

Answers to questions in Stage I. were given in our issue for May 23rd, and to Stage II. in the issue for June 6th.

NOTES ON COMPETITIONS.

Peace Palace Competition.

To those who did not take part in the Peace Palace competition, and who may not have an opportunity of seeing the report of the international jury which was appointed to consider the designs submitted, the following brief account of the doings of the jury may prove of interest:—The jury determined upon a method of procedure, and then separated in order that each member might study all of the 216 designs by himself. The designs were then re-examined by the jury in a body, and all those were rejected which failed to obtain a single favourable vote. Forty-four designs were thus retained for further consideration, and a vote by ballot was taken. Designs which failed to receive at least four favourable votes were set aside. The number of designs thus became reduced to sixteen. These sixteen designs were subjected to several renewed examinations, and the ultimate verdict was obtained by a vote of majority. The report would have been a much more interesting document had it contained a list of the forty-four designs which were first selected, classified under headings of nationality; and more interesting still had a full list of all designs submitted been included, similarly classified. From the list as it stands it is impossible to select the mottoes which accompanied British designs and those which did not, for they are, with one exception, either in Latin, French, German, Italian or symbols. The only English motto is "Triumphant Democracy," and this of course is no evidence that the design is of British origin. The word "Pax" abounds

in various forms and combinations, as was inevitable, and "Skibo" stands defiantly and leaves one speculating upon the land of its birth. Of the six premiated designs, four were by architects who had been specially invited by the committee to take part in the competition. The report concludes with a short description and criticism of the premiated designs. It is somewhat disconcerting to learn that the style of the design placed first, which we had all been informed by the newspapers was that of ancient French chateaux, is considered by the assessors as being in accordance with the local traditions of sixteenth-century architecture as obtaining at the Hague, and this is the chief reason why the design was selected. It is surprising that a reason of this sort should have prevailed with a majority of an international jury, beyond all other considerations, in this our year of grace 1906, and in connection with a monument the like of which history has not known. Let us with all haste state that this country's representative was numbered with the minority at that fateful issue. In view of the designs which have already been seen and published, the notes in the report are un-descriptive and unconvincing. The jury appear to have failed to approach the subject with the breadth of spirit which was expected of them, and the admission is reluctantly torn from one that the architectural aims and ideals of different nations, though each tending in varying degrees towards a common end, are not yet in a sufficient state of unity to render an international competition anything but a disappointment. It is stated that none of the designs sent in for this Palace of Peace are considered satisfactory by the promoters, and a new competition among forty competitors is suggested.

Convalescent and Nursing Home, Glossop.

This competition was referred to in our issue of May 30th as being particularly unsatisfactory. We were able to announce, a week later, that there was hope of an assessor being appointed and the conditions being revised. These hopes have now been confirmed by a communication from the town clerk to all applicants for conditions, which states that it has been decided to appoint an assessor and to supply additional information to architects desirous of competing. The committee intend to visit some institutions similar to the one they propose to have erected, in order to give them some idea of the accommodation it will be necessary to provide. The additional information, therefore, is not likely to be forthcoming for several weeks. It was the lack of information in the conditions, as well as the absence of an assessor, which was particularly complained of. The architect, in fact, was to have supplied the committee with all the information they ought to have acquired for themselves. It is a pleasure to be able to record that the committee now appear to be doing all in their power to make the competition a success.

Hospital at Stone.

Mr. W. A. Pite, F.R.I.B.A., of London, has been appointed assessor in the competition for the proposed new hospital to be built at Stone.

New Infirmary, Edmonton.

This competition is limited to five architects, the assessor being Mr. Rowland Plumbe, F.R.I.B.A. The total cost of the building is put at £250,000.

Dublin Technical Schools.

At last week's meeting of the council of the Royal Institute of the Architects of Ireland the question of the correspondence with the Corporation in connection with the promotion of a competition among Irish architects for the design of the proposed new technical schools in Dublin was considered.

Correspondence.

The A.A. Evening Studio.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—May I call your attention to an incorrect statement made in your last issue? It is there stated that the evening studio of the Association is being closed. This is by no means the case. The council has for some time past had under consideration the advisability of amalgamating the evening studio (formerly conducted by Mr. W. G. B. Lewis) with the evening continuation school, as with the two schools under separate heads there was much overlapping, and from a financial as well as an educational point of view the new scheme will be advantageous to all students, as provision will be made not only for students who have passed through the day school but for students who are engaged in offices during the daytime, as well as those wishing to prepare for the R.I.B.A. examinations or desirous of taking up special subjects in design or construction. The new arrangement will provide evening instruction which will supply the wants of all grades of students without disturbing the smooth working of the scheme of continuous study, and it was evident to the council that the time had arrived when the studio system should be codified into one scheme.—Yours truly,

H. TANNER, junr.,

Hon. Secretary,

WESTMINSTER. Architectural Association.

[As the statement made in our columns was furnished by the late instructor of the school, Mr. Lewis, we assumed it was correct.—ED. B. J.]

R.I.B.A.

Presentation of the Royal Gold Medal.

THE last meeting of the session of the Royal Institute of British Architects was held on Monday evening at 9, Conduit Street, W., the occasion being the presentation of the Royal Gold Medal to Sir Laurence Alma-Tadema, R.A.

In presenting the medal Mr. John Belcher, A.R.A., president, referred to the good service Sir Alma-Tadema had rendered to architecture—indirectly for the most part, yet not the less substantially and really—and though he was known to the world chiefly as a great painter, the Institute felt no hesitation whatever in presenting his name to the King for the Royal Gold Medal.

After referring to Sir Alma-Tadema's "style," the president mentioned two well-known pictures of his—"Architecture in Ancient Rome," in which he depicts the architect engaged on his work, and the other in which the sculptor Phidias is represented putting the finishing touches to the Parthenon frieze and explaining it (apparently) to his friends and patrons.

As a wonderful illustration of Sir Laurence Alma-Tadema's architectural knowledge, and the clearest proof of the practical value of his archæological researches, he called attention to the series of designs which he made for Sir Henry Irving for the scenery to illustrate Shakespeare's play of "Coriolanus."

Sir Alma-Tadema, in replying, said the sister arts had always appeared to him indivisible—different parts of a single whole; and he realized that from this point of view he might be regarded as a link of some interest. In some of his works he had tried to reconstruct antique buildings; in others he had been concerned with the proportions of figures to architecture.

Mr. Andrew Moseley, F.R.I.B.A., of Fulham, S.W., died recently, aged 94.

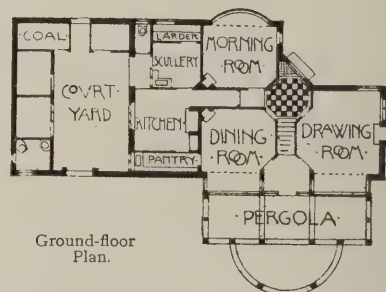

Mr. Philip Wilkinson, F.R.I.B.A., of London, died on June 13th.

This house has been built at a cost of about £1,000, Mr. Harold Falkner being responsible for it. The interior is very interesting. The dining-room is panelled throughout with Jacobean oak with exposed ceiling joists, and in the drawing-room is a frieze modelled by artists of the Bromsgrove Guild of Craftsmen. Some of the fireplaces have tiles from a local pottery. On the other side of the house to that shown above is a pergola, leading out to the garden.

First-floor Plan.

Ground-floor Plan.

OUR PLATES.

New Central Library, Bristol.

THE new central library in Deanery Road, Bristol, was formally opened by Lord Winterstoke last Wednesday. To the left of the main front on the ground floor is the entrance, leading into a spacious hall. This is lined with veined green marble, with blue mosaic on the vaults: the floor being of Piastraccia marble, the wall skirting and bases to piers in Grande Antique, the dado of Cipollino, and the capping of Irish green marble. Leading out of this hall is the lobby to the newsroom on the front and the lending library at the back, and, at the opposite end, the magazine-room, this last leading out from the newsroom. The lending department provides accommodation for 25,000 volumes. At the end of the entrance hall is the staircase to the upper floors. This is very cleverly contrived on a semi-circle. The chief room on the first floor is the reference library, which fronts Deanery Road and has large bay windows at either end and three small bays in between, groups of statuary being placed in recesses under the arches over the small bays. The reference library is 150ft. long and 40ft. high and holds about 100,000 volumes. It is a very

fine room, in stonework, with handsome electroliers depending from the arched ceiling. Leading out of this room is what is called "the Bristol room," containing the Bristol collection of books. This room has a richly carved chimneypiece (by Grinling Gibbons) and bookcases brought from the old library in King Street. The rest of the first floor is taken up with the chief librarian's rooms, at the back of the building, while book stores and the upper part of the reference library occupy the top floor. The architect of the building is Mr. H. Percy Adams, F.R.I.B.A., of London, whose design was selected in competition, for which sixty-one designs were submitted, Mr. E. W. Mountford being the assessor. The builders were Messrs. Willcock, of Wolverhampton. Adjoining the library is the Norman Abbey gateway to Bristol Cathedral. This had to be taken in account in the design of the new building.

Peterborough Cathedral Restoration.—The Peterborough Cathedral Restoration Committee are about to undertake the repair of the north transept on the advice of their architect, Mr. G. F. Bodley, R.A. The north wall leans a good deal, but Mr. Bodley thinks the settlement took place a considerable

time ago and that the masonry has now got its bearing. The cracks and displacements require to be carefully treated. Mr. Bodley says: "The building must obviously be accepted as an ancient one, and all the old work that it is possible to retain should be retained. But all that adds to the durability of the fabric and to its greater preservation should be certainly carried out as soon as is possible, and any glaring deficiency should be made good."

Tests with Firegrates.—In the article in our issue for June 6th dealing with the tests with domestic firegrates carried out at the new Government Offices in Whitehall by the Smoke Abatement Society, in conjunction with Sir Henry Tanner, we illustrated the grate of Messrs. Hendry & Pattison, Ltd., which was bracketed with those of Messrs. J. & R. Corker, Ltd., and Messrs. Candy & Co., as giving the best results. The grate illustrated was the firm's "warm-air" grate, and though actually tested in the tests, it was not the one tested in the final test. This latter was a "non-warm air" grate, exactly similar in construction to the other, except that there is no air chamber at the back. We are asked to point this out in order to remove any misunderstanding.

Enquiries Answered.

Questions should in all cases be addressed to the Editor and be written on one side of the paper only.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters.

Correspondents are particularly requested to be as brief as possible.

The querist's name and address must always be given, not necessarily for publication.

Scantlings for Framed Floor.

MARCH.—PROBATIONER writes: "Please advise me as to the scantlings of a framed floor, room 20ft. by 30ft., for the testimony of study required for the Intermediate R.I.B.A. examination. I send small sketch

plan showing sizes as I have worked them out."

It is not stated whether the floor is for a public building, warehouse or private dwelling; the purpose would make a difference in the load to be allowed for. Taking the load, including weight of floor itself, to be $1\frac{1}{2}$ cwt. per ft. super., the wood girders would have to carry $\frac{30}{4} \times 20 \times 1.5 = 225$ cwt. Then

by formula $w = \frac{bd^2}{L}$, $225 = \frac{bd^2}{20}$, or $bd^2 = 4500$. Assuming b to be $\frac{4}{5}d$, then $\frac{4}{5}d^3 = 4500$, or $d^3 = 4500 \times \frac{5}{4}$, or $d = \sqrt[3]{5625} = 17\frac{3}{4}$ ins., and $b = \frac{4}{5}d = 17.75 \times \frac{4}{5} = 14\frac{1}{4}$ ins.

This formula without a constant allows a factor of safety of 7, which is not too much for permanent work. The binders would have to carry $\frac{20}{3} \times \frac{30}{4} \times 1.5 = 75$ cwt.

Then $w = \frac{bd^2}{L}$, $75 = \frac{bd^2}{7.5}$, or $bd^2 = 75 \times 7.5 = 562.5$. Assuming b to be $\frac{5}{8}d$, then $\frac{5}{8}d^3 = 562.5$, or $d^3 = 562.5 \times \frac{8}{5}$, or $d = \sqrt[3]{900} = 9\frac{3}{4}$ ins.; and $b = \frac{5}{8}d = 9.75 \times \frac{5}{8} = 6$ ins. The common joists would have to carry $\frac{7.5}{6} \times \frac{20}{3} \times 1.5 = 12\frac{1}{2}$ cwt. Then $w = \frac{bd^2}{L}$, $12.5 = \frac{bd^2}{6.6}$, or $bd^2 = 12.5 \times 6.6 = 83.3$. Assuming b to be $\frac{2}{3}d$, then $\frac{2}{3}d^3 = 83.3$, or $d^3 = 83.3 \times \frac{3}{2}$, or $d = \sqrt[3]{125} = 5$ ins.; and $b = \frac{2}{3}d = 3\frac{1}{3}$ ins.

$\sqrt[3]{292} = 6\frac{5}{8}$ ins.; and $b = \frac{2}{3}d = 6.625 \times \frac{2}{3} = 4\frac{1}{2}$ ins.

say, 2 ins. With the exception of the common joists; the scantlings proposed are insufficient, moreover, the method of framing the floor is out of date; rolled steel joists should be substituted for the wood girders.

HENRY ADAMS.

Concrete and Iron Floors.

GLASGOW.—J. G. F. writes: "I purpose making the upper floors in a villa of breeze-concrete, supported by I-beams at 4ft. centres. The spans are 12ft. and 15ft. in the clear. What sizes and weights of beams should I employ; also thickness of concrete. Is there any objection to finishing the floors with granite, i.e., dispensing with floorboards entirely? Where hollow spaces are employed is it necessary to brander and lath the outside walls?"

We really cannot continue to answer such simple questions as this. We have dealt with such subjects over and over again in our columns. Our correspondent ought to be able to determine such elementary questions himself; if he cannot his education has been sadly neglected. We are always ready to advise readers upon any points of real difficulty or out-of-the-way problems, and we are continually publishing theoretical and practical articles on the principles of construction, which our correspondents must apply for themselves in their everyday practice.

Book on Operating Theatres.

W. writes: "Which is the best publication on the modern operating theatre for a county hospital? Please name any theatres recently erected that would repay a visit of inspection."

There are no recent books upon the particular branch of hospital design you name. Almost any recently-erected hospital will serve for study. We would suggest the General Hospital, Tunbridge Wells (H. Percy Adams, architect) or Camberwell Infirmary (Edwin T. Hall, architect). Plans and elevations of the operating-theatre at the latter are published in "Specification No. 9" (3s. 3d. post free from our offices).

Hospital Construction.

BATLEY.—X. Y. Z. writes: "(1) Which is the most recent plan or arrangement of conveniences and bathrooms (cross-ventilated) to a hospital ward? (2) What is the least size of such a bathroom to accommodate slipper bath and lavatory basins (two),

and also the usual size of the w.c. rooms? (3) What is the most suitable width for hospital-ward windows, and the usual height up to sill from floor-level? (4) Do you consider it any advantage to have hot-water piping to the wards, in addition to Shorland's patent stoves?"

(1) See recent plans published in our columns, in "Specification" Nos. 7 and 9, and in the "Hospital." (2) Bathroom about 10ft. by 7ft., but the shape can be modified; w.c.'s are usually about 3ft. by 5ft. (3) 3ft. to 3ft. 6ins. wide, about 3ft. above the floor. (4) We do not think hot-water piping advisable. It collects dirt, and is troublesome to keep clean. The heating and ventilation can also be combined on the "plenum" system.

Exemption from Examination.

TONBRIDGE.—LEGAL writes: "Does the R.I.B.A. preliminary examination exempt one from the preliminary examination of the Incorporated Law Society?"

We should not think so, but you might write to the secretary of the Incorporated Law Society, Chancery Lane, London, W.C.

Floor for Bath.

WOLVERHAMPTON.—G. P. writes: "It is proposed to use for public meetings, concerts, &c., a swimming bath with a pond roof, by 40ft., and it is desired to provide a temporary floor level with the promenade round the pond. Kindly explain a simple method of constructing this floor."

See an article in our issue for April 3rd, 1901.

Roof for Hall.

DUMFRIES.—ROOF writes: "I send rough cross-section of a small hall 24ft. 6ins. wide, height to underside of tie 15ft. 6ins., wall head 10ft. 6ins., slope of roof 45 degs., thickness of wall 1ft. 6ins. What kind of roof should be used over this span, and what sizes of timber would be required? The ceiling of the hall is to be plastered."

A collar-beam roof should not be used over a span exceeding 18ft., but if care be taken and the timbers be made sufficiently large, there is probably no very great risk in increasing the maximum span to 25ft. in places that are not exposed to the wind. In the present case the roof might be as shown by the accompanying drawing, but it will be rather a light one. The collar is on every pair of rafters.

HENRY ADAMS.

ROOF FOR SMALL HALL.

Complete List of Contracts Open.

With a few exceptions, news of Contracts Open are not repeated after they have been published once in these columns, so that readers will find particulars in our previous issues of other contracts that still remain open.

Unless expressly stated to the contrary all deposits required for bills of quantities, &c., are returned on receipt of bona-fide tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair-wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

June 28. Seaford.—*Stabling, riding-school and house*, for the Seaford West Co., Ltd., at Seaford. Names to be sent in at once to W. Lambe, Estate Office, Claremont Road, Seaford, Sussex, from whom quantities and other particulars can be obtained in due course on deposit of £3 ss., which will be returned on receipt of a bona-fide tender. All tenders to be sent sealed to the Estate Office by noon on June 28.

June 30. Kilkeel.—*Construction of a concrete wall* at Kilkeel Harbour. Drawing and specification may be seen at the office of the County Surveyor, Courthouse, Downpatrick, and at the office of the R.D.C., Union Workhouse, Kilkeel. Tenders, endorsed "Kilkeel Harbour Wall," to be lodged in the office of James Heron, county surveyor, before noon on June 30.

June 30. Leeds.—*Erection of house and shop and two back to back houses*, in Harehills Lane, Leeds, for T. H. Aze. Contractors desirous of tendering for the whole trades must forward their names to Thomas Winn and Sons, architects and surveyors, 84, Albion Street, Leeds, on or before June 30.

June 30. New Elgin.—*Mason, carpenter, plumber, slater, plasterer, painter and glazier works* of a cottage to be erected in Rothes Road, New Elgin. Plans and specifications to be seen with James Jameson, architect, 77, High Street, Elgin, and tenders must be lodged with him by June 30.

June 29. South Molton.—*Erection of a new farmhouse* on the Whitechapel Estate, near South Molton, Devon. Plans and specifications may be seen and bills of quantities obtained on payment of £3 from E. H. Harbottle & Son, architects, County Chambers, Exeter, to whom sealed and endorsed tenders must be sent on or before June 29.

June 30. Haywards Heath.—*New public elementary Council school*. Persons desirous of tendering are requested to send their names and addresses to the county surveyor of East Sussex (F. J. Wood), County Hall, Lewes, on or before June 30, from whom full particulars can be obtained.

June 30. Belfast.—*Erection of the Jaffe Memorial Schools* at Cliftonville, Belfast. Plans and specification may be seen at the offices of Young & Mackenzie, architects, Scottish Provident Buildings, Belfast, and schedule of quantities obtained from A. Ferguson, building surveyor. Sealed tenders, addressed to Sir Otto Jaffe, J.P., to be lodged with the Architects on or before June 30.

June 30. Halifax.—*Alterations and extensions* to shop in Broad Street, Halifax. Plans may be seen and bills of quantities obtained at the offices of Jackson & Fox, architects, 7, Rawson Street, Halifax, to whom tenders must be sent by noon on June 30.

June 30. Ashburton.—*Erection and completion of two villa residences* in the Higher Western Field, on the Druid Estate, for the Ashburton Building Co., Ltd. Drawings, conditions and specification may be seen, and forms of tender, together with bills of quantities, obtained on application at the offices of R. Montague Luke, civil engineer, 15, Princess Square, Plymouth, and upon payment of a deposit £2 ss. Copies of drawings and specifications may also be seen on application to W. H. Langier, secretary of the Company, Maythorne, Ashburton. Sealed tenders, endorsed "Tender for Villas," must be delivered to the Secretary not later than June 30.

July 2. Eccles.—*Rebuilding the "Blue Bell" Hotel*, Monton Green, Eccles. Copies of quantities may be obtained from the architect, N. Hartley Hacking, 50, Blackfriars, Manchester, on payment of £2 ss. Plans may be seen at the Architect's office from 10 a.m. to 4 p.m. Sealed tenders to be delivered to the Architect not later than July 2.

July 2. Lochgelly.—*Brick and digger, joiner, plumber, slater, plaster, glazier, iron, grates and painter works* of 100 houses, also for nine cottages to be erected in Lochgelly, for the Lochgelly, Iron and Coal Co., Ltd. Schedules of quantities may be had and plans can be seen at the office of W. Birrell, architect and surveyor, 200, High Street, Kirkcaldy, on deposit of £1 rs. Offers to be lodged with the Secretary of the Company, 40, St. Vincent Place, Glasgow, on or before July 2, sealed and endorsed "Tender &c., Houses, Lochgelly."

July 2. Aylesbury.—*Erection of a new infants' school*, for about 100 children, at Wraysbury, and minor alterations to existing school, under the superintendence of the Works Department, Education Office, Aylesbury. Applications are to be accompanied by particulars of any responsible work previously carried out by the Contractors, together with names and addresses, for reference, of at least three architects who have superintended such work. Subject to the approval of the Education Committee, the competition will be limited, and contractors selected for tendering will be required to deposit £1 rs. for the bills of quantities supplied. Plans, specifications and conditions can be seen at the Works Department, Education Office, Aylesbury. Applications to be sent to the undersigned on or before July 2.

July 2. Elgin.—*Mason, carpenter, plumber, and painter, works of improvements* at Duffus School. The plans and specifications may be seen with John Wittet, architect, Elgin, and at the School, and estimates must be lodged with the architect, on or before July 2.

July 2. Bingley.—*For the bricklayer's and mason's (including ironfounder's work), carpenter's and joiner's, slater's, plumber's, plasterer's, and painter's work*, required in the erection of dressing, twisting, and store rooms, at the Albert Mills, Bingley, for A. R. Wright. Plans may be seen and quantities obtained at the office of W. Rhodes Nunns, M.S.A., architect and surveyor, 13, Market Street, Bingley, up to July 2.

July 3. Stockport.—*Manual and team labour and materials* required in the erection of car shed extension and river retaining wall at Mersey Square, Stockport. Plans, sections, specifications and conditions may be seen and forms of tender obtained on application to the Borough Surveyor, St. Petersburg, Stockport, on payment of £1 rs. Tenders, addressed "The Town Clerk, Stockport," sealed and endorsed "Tender for Car Shed Extension," to be left at his office at or before noon on July 3.

July 3. Utrecht (Holland).—*Construction of station buildings* at Boarle-Nassau. For particulars apply to Director of Dutch State Railways, Utrecht. Tenders to be in by July 3.

July 3. London, N.E.—*Work required to be done in forming area and steps to boiler-house, and in the alteration of the drains to "C" Block of the Vallance Road Infirmary, N.E., for the Whitechapel Guardians*. A copy of the specification, &c., may be obtained at the Guardians' Offices, 74, Vallance Road, Whitechapel, on payment of £1 rs. Sealed tenders, upon a form which will be issued with the specification, must be delivered at the Guardians' Offices before noon on July 3.

July 3. Aberavon.—*Erection of a residence* at Pentyla, Aberavon. Plans and specifications may be seen at the office of J. A. James, architect, Port Talbot, to whom tenders are to be delivered not later than July 3.

July 4. Cork.—*Erection of morgue* for the Por-Sanitary Authority, in accordance with plan and specification, which may be inspected at the office of John Ahern, town surveyor, Queenstown. Tenders will be received by M. O'Keefe, clerk, Municipal Buildings, Cork, up to 5 p.m. on July 4.

July 4. Cork.—*Repairs to the Intercepting Hospital*, Queenstown, for the Port Sanitary Authority. Copy of specification may be obtained on application to the Clerk, by whom tenders will be received up to 5 p.m. on July 4.

July 4. Neath.—*Erection of business premises* in Windsor Road, Neath. Plans, &c., can be seen on application to Andrew Bracey, house furnisher, 137, Windsor Road, Neath. Quantities can be obtained on deposit of £2 ss. Tenders to be sent in under seal to above address, endorsed "Tenders for Business Premises, Windsor Road, Neath," on or before July 4.

July 4. Monmouth.—*Erection of new buildings* for the Baptist Church. The drawings and specification can be inspected on application to W. Sambrook, or at the offices of B. Lawrence, architect, Newport, from whom bills of quantities can be obtained on the deposit of £1 rs. The tenders are to be sent under cover to W. Sambrook, Wyesham, near Monmouth, by July 4.

July 4. New Sarum.—*Erection of a cabmen's shelter and convenience* in Fisherton Street, and a public latrine in Castle Street. The plan and specification of the proposed buildings may be seen, and bill of quantities, together with form of tender, can be obtained at the office of the City Surveyor, Endless Street, Salisbury, on payment of £1 rs. Sealed tenders, endorsed "Latrines," must be sent to Francis Hoddling, Town Clerk, Municipal Offices, Salisbury, on or before July 4.

July 5. Devonport.—*Erection of a new administrative building* at the Infectious Diseases Hospital, near North Prospect. Plans, specifications, and conditions may be seen and forms of tender and quantities obtained on application to the Borough Surveyor, 29, Ker Street, Devonport, to whom tenders must be delivered, properly endorsed, on or before 10 a.m. on July 5. The sum of £1 rs. will be required as a deposit. Fair wages clause.

July 5. Bingley.—*Erection of a washhouse* at Bingley. Plans can be seen and quantities obtained at the offices of Samuel Jackson & Son, Tanfield Chambers, Bradford, from June 30 to July 5.

July 5. Dewsbury.—*Erecting about 217 yds. of brick walling* at the washhouse at Staincliffe. Specification and particulars to be obtained from the master of the Workhouse. Tenders to be delivered to Joseph Peace, clerk to the Guardians, Union Offices, Wellington Street, Dewsbury, not later than July 5.

July 5. Belfast.—*Erection of workmen's cottages* on the Mill Town Road, Purdysburn. Plans and specifications can be seen at the offices of Young & Mackenzie, architects, Scottish Provident Buildings. Sealed tenders, endorsed "Tender for Cottages," to be lodged in the Town Clerk's Office, before 11 a.m. on July 5.

July 5. Cardiff.—*Erection of shops and premises* according to the plans of E. H. Bruton, F.R.I.B.A., Cardiff, for G. A. Spencer, The Square, Senghenydd, where plans and specification may be seen on June 27, and to whom tenders are to be sent not later than July 5.

July 5. London.—*Erection of seven coal offices* at Finchley Road, London, for the Midland Railway Co. Plans and specifications may be seen, quantities and

particulars obtained on application at the Engineer's Office, Derby Station. Sealed tenders to be forwarded by post to the Secretary of the Way and Works Committee, Midland Railway, Derby, not later than 9 a.m. on July 5.

July 6. Dublin.—*Erection of vestry and heating arrangements* to mortuary chapel in Deans Grange Cemetery. Plans and specifications can be seen at the Cemetery (Registrar's Office) during office hours, 8.30 till 4 o'clock. Tenders to be delivered at Deans Grange Cemetery on or before July 6.

July 6. Newton Abbot.—*Erection of a six-stall stable* at Newton Abbot, for the Great Western Railway Co. Plans and specification may be seen and forms of tender and bills of quantities obtained at the office of the Engineer at Plymouth Station, between 10 and 4. Tenders, addressed to G. K. Mills, secty., Paddington Station, London, and marked outside, "Tender for Stable, Newton Abbot," will be received on or before July 3.

July 7. Stafford.—*Alterations and improvements to Stretton Council School*, near Burton. Builders desiring to tender for the work should apply to Graham Balfour, Director of Education. Quantities will be supplied, for which a deposit of £1 rs. will be charged. The drawings and specification can be seen at the offices of the Education Committee at Stafford.

July 7. Eccles.—*Erection of the Carnegie Public Library* in Church Street. A copy of the bill of quantities, general conditions and form of tender may be obtained at the Town Clerk's Offices on depositing the sum of £2 ss. The plans may be inspected and further particulars obtained at the office of the architects, Potts, Son & Hennings, 34, Victoria Buildings, Victoria Street, Manchester. Tenders, endorsed "Tender for Carnegie Library," to be delivered to Edwin Parkes, town clerk, Town Hall, Eccles, not later than noon on July 7.

July 7. Truro.—*Alterations and additions* to the Bella Vista College, Truro, according to plans and specifications which may be seen at the County Education Office, Truro, or by appointment at the office of Sampson Hill, architect to the Committee, Green Lane, Redruth, from whom all particulars relating to the work may be obtained. Sealed endorsed tenders, on official forms which may be had from the Secretary or the Architect, are to be sent to F. R. Pascoe, secty., Education Office, Truro, on or before July 7. The alterations to the building are to be completed before September 29 next.

July 9. Birmingham.—*Reconstruction of a portion of the tramway depot* in Kyott's Lake Road. Applications for forms of tender and bills of quantities may be made on or before June 28, at the office of the quantity surveyor, Anthony Rowse, King's Court, Colmore Row, Birmingham. Before obtaining the bills of quantities, it will be necessary to deposit a sum of £3 ss. for which a receipt will be given. The drawings may be seen on and after the same date at the office of the architect, Frank Barlow Osborn, F.R.I.B.A., 13, Bennett's Hill, Birmingham. Fair wages clause. Tenders must be delivered not later than noon on July 9 in sealed envelopes, addressed to the Chairman of the Tramways Committee, Council House, Birmingham, endorsed "Tender for Tramway Depot."

July 9. Limerick.—*Erection of twelve farmhouses* at Mount Shannon, near Limerick for the Irish Estate Commissioners. Plans and specifications can be obtained from the secty., Estates Commissioners, on receipt of £1 rs. Tenders should be enclosed in a sealed envelope, marked "Tender" in left hand corner, and addressed to The Secty., Estates Commissioners, 26, Upper Merion Street, Dublin. The latest date for the receipt of tenders will be noon on July 9.

July 9. Hastings.—*Alterations and additions to the existing grammar school buildings* and for the erection of a workshop. Plans and specification may be seen and quantities obtained at the offices of the architects, A. W. Jeffery & Son, 5, Havelock Road, Hastings, on payment of a fee of £1 rs. Sealed tenders, endorsed "Grammar School Tender," to be addressed to "The Clerk, Education Committee," 18, Wellington Square, Hastings, not later than noon on July 9.

July 9. Southampton.—*Works of external and internal repairs, gravelling, lavatory accommodation, rebuilding, lighting, ventilation, and new offices* to Grately School. Tenderers may see plans and conditions of contract, and obtain specification at the office of W. J. Taylor, county surveyor, The Castle, Winchester. Plans and conditions of contract may also be seen at the school. A deposit of £1 rs. will be required for a copy of the specification. Deposits must be made by cheque payable to Hants County Council, and crossed Bank of England, or particulars will not be sent. Tenders, endorsed "Proposed work, Grately Council Schools," are to be delivered to H. Barber, clerk to the County Council, The Castle, Winchester, on or before July 9.

July 10. Isle of Wight.—*Repairs to the Havenstreet School*. Plans and specifications may be seen at the County Education Offices, Newport, I.W., or at the offices of the County Surveyor, St. Thomas's Street, Ryde, I.W. Sealed tenders, endorsed "Havenstreet School," should reach F. G. Flux, secty., County Educational Offices, Newport, I.W., not later than July 10.

July 10. Croydon.—*Erection of a school* for 1,200 children, proposed to be built in Davison Road, Croydon, in accordance with the drawings prepared by H. Carter, Pegg, F.R.I.B.A., of Thornton Heath. Bills of quantities

and forms of tender can be obtained at the Committee's Office, upon payment of £1 rs. Applications should reach James Smyth, clerk to the Committee, Education Office, Katharine Street, Croydon, not later than June 20, and tenders must be delivered not later than noon on July 10. Tenders will only be received subject to the plans, specification and the terms of the draft contract, which will be deposited at the Committee's office and may be inspected during office hours.

July 10. London, S.W.—Erection of two public elementary schools, one to accommodate 836 children on the Lawn Lane site, South Lambeth Road, S.W., and the other to accommodate 804 children on the Franciscan Road site, Tooting Craveney, S.W., for the L.C.C. Persons desiring to submit tenders may inspect the drawings and specification and obtain the bills of quantities, forms of tender, and other particulars, at the Education Offices (Architect's Department), Victoria Embankment, W.C., upon payment to the Cashier of the sum of £5 in each case. Fair wages clause. Each tender must be enclosed in the envelope provided and delivered at the Education Offices, Victoria Embankment, W.C. (Room No. 119), not later than 11 a.m. on July 10, after which hour no tender will be received. Any tender which does not comply with the printed instructions for tender may be rejected.

July 11. Newcastle-on-Tyne.—Remodelling and extending the Mason Dinnington (Mixed) Council School, situate near Newcastle-on-Tyne, also for the erection of a new infant Council school to accommodate 150 scholars, to be erected immediately adjoining the existing mixed school buildings, for the County Council Education Committee. Contractors will be required to tender for both works, and those desirous of tendering should forward their name and address to the undersigned not later than June 28, together with a deposit of £2 2s. Plans of both works may be inspected at the Committee's offices, and sealed tenders, endorsed "Tenders for Dinnington New School and Improvements," must be forwarded to C. Williams, secretary to the Education Committee, Pearl Buildings, Newcastle-on-Tyne, not later than 10 a.m. on July 11.

July 12. Llanerchymedd.—Additions and alterations to the Council school, together with new infants' school, out-offices, boundary walls, &c. Plans and specifications may be inspected at the Llanerchymedd Council School, and at the office of J. Owen, F.R.I.B.A., county architect, Menai Bridge. Tenders, endorsed "Llanerchymedd School," (on forms which will be supplied by the Architect), to be delivered to R. H. Williams, secretary of education, Education Offices, Llangefni, not later than 10 a.m. on July 12.

July 12. Dewsbury.—Erection of a new head post-office at Dewsbury. Drawings, specification and a copy of the conditions and form of contract may be seen on application to the Postmaster between 10 a.m. and 5 p.m. Bills of quantities and forms of tender may be obtained at the Office of Works on payment of £1 rs. Tenders must be delivered before noon on July 12, addressed to the Secretary, H.M. Office of Works, &c., Storey's Gate, London, S.W., and endorsed "Tender for Dewsbury Post-office."

July 17. Edmonton.—Alterations and additions to the Brettenham Road School, together with the annual cleansing and repairs at their Brettenham Road and Croyland Road Schools. Persons desirous of tendering should send their names to the architect, Henry W. Dobb, Town Hall, Lower Edmonton, on or before Monday, July 2, when specifications, plans and form of tender will be forwarded. Fair wages clause. Tenders must be delivered to John Moule, secy., Education Offices, Brettenham Road, Upper Edmonton, on or before noon on July 17.

July 25. Birmingham.—Erection of six homes for epileptics and other works on the Monyhull Hall Estate, near King's Heath, Birmingham, according to plans and specifications prepared by C. Whitwell and Son, architects to the Joint Committee. Builders desirous of tendering must apply to R. J. Curtis, clerk to the Joint Committee, Guildhall Buildings, Birmingham, in writing, and deposit the sum of £25 on or before June 30. Bills of quantities will then be forwarded, together with instructions as to the inspection of plans and drawings. The amount of the deposit will be returned by the Joint Committee's cheque to those who deliver a bona fide tender to me on or before July 25. No tender will be definitely accepted until the Local Government Board has finally approved the plans and estimates.

August 16. Antwerp.—Reconstruction of the Government Bonded Warehouses, known as the "Nord-Ancien and Nord-Nouveau." The specification ("Cahier des charges," No. 1,144) relating to the contract may be obtained from the Hôtel de Ville, Antwerp, at a cost of 2 francs. All tenders should be sent in sealed registered envelopes, addressed "A Monsieur le Bourgmestre en l'Hôtel-de-ville d'Anvers," and should reach the Hôtel de Ville not later than August 16. A deposit of £1,000 is required to qualify any tender. A copy of the specification may be seen at the offices of the Commercial Intelligence Branch of the Board of Trade, 73, Basinghall Street, London, E.C.

No date. Meltham.—Mason's work required in the erection of sprinkler tower on the top of the present staircase of the cotton mill at Meltham. For particulars apply to W. Carter, Station Street, Meltham.

ENGINEERING.

June 28. Birmingham.—Works in connection with the reconstruction and widening of Fazeley Street canal bridge. The drawings and specifications may be inspected and quantities and forms of tender obtained on deposit of £1, at the City Surveyor's Office. Tenders, endorsed "Fazeley Street Bridge," to be sent in to T. Arnall, A.M.I.C.E., acting city surveyor, Council House, Birmingham, by June 28. Fair wages clause.

July 2. London, E.—Supply and fixing of iron roof trusses and an overhead traveller at the pumping station, Vicarage Lane, East Ham. Full particulars may be obtained from the borough engineers. Tenders to be delivered addressed to the "Chairman, Public Health

Committee, Town Hall, East Ham," not later than July 2. Fair wages clause.

July 2. Selly Oak.—Supply and fixing of the laundry and general machinery at Selly Oak Baths, in accordance with the drawings and specifications prepared by the consulting engineer, W. M. Binney, A.M.I.C.E. Drawings, specifications and other particulars may be seen on application at the Surveyor's Office, 23, Valentine Road, King's Heath, and forms of tender obtained on deposit of £1 rs. Tenders, endorsed "Machinery for Selly Oak Baths," are to be delivered at the office of Edwin Docker, clerk to the Council, 10, Newhall Street, Birmingham, by July 2.

July 2. London, E.C.—Supply and delivery of 100 feet girder bridges for the Bengal and North-Western Railway Co., as per specification to be seen at the Company's offices. Tenders, addressed to Alexander Izat, managing director, 237, Gresham House, Old Broad Street, E.C., are to be lodged not later than noon on July 2. For each specification a fee of 10s. will be charged, which cannot under any circumstances be returned.

July 6. Warwick.—Construction of covered service reservoir (capacity about 500,000 gallons), and the provision, laying and jointing of about 500 yds. of 12in. and 8in. cast-iron pipes, together with all special castings and valves required; also for the erection of engine-house and gas-producer house, and other works in connection therewith, in accordance with the plans, sections, detail drawings and specification prepared by the Engineers. Plans and specification may be seen and form of tender and bills of quantities obtained at the offices of the engineers, Wilcox & Raikes, 63, Temple Row, Birmingham, on payment of a deposit of £3 3s. The tenders must be sent in under seal in envelopes supplied, endorsed "Warwick Water Supply, Contract No. 4," to Brabazon Campbell, town clerk, Warwick, not later than noon on July 6.

July 11. London, S.W.—Work and materials required in the construction of the permanent way (for electric traction), bridge work, road widenings, &c., for Contract No. 17, for the Middlesex County Council, Railway No. 1 (Order 1903). A line of double track (with crossovers, contingent works, &c.) to be laid along Green Lanes, in the districts of Wood Green and Southgate, in the county of Middlesex, to a length of 3 miles or furlongs, 4 chains, or thereabouts. The plans, conditions of contract, specification of works, &c., for this contract may be seen and schedule of quantities obtained by intending contractors, on payment of £10, on application to H. T. Wakelam, M.I.C.E., county engineer, Middlesex Guildhall, Westminster, S.W. Tenders, properly sealed and endorsed "Tender for Light Railway No. 1," to be delivered to Sir Richard Nicholson, clerk of the County Council, Middlesex Guildhall, Westminster, S.W., not later than noon on July 11.

July 12. Ciney (Belgium).—Installation of new pumping apparatus for the water-supply works. Particulars may be obtained from the Secretariat Communal, Ciney Namu. Tenders to be sent in by July 12.

July 20. Birmingham.—Construction of a covered filtered water reservoir and connections at the Frankley Waterworks, Northfield, near Birmingham. The drawings may be seen and specifications and bills of quantities obtained at the offices, 44, Broad Street, Birmingham, on and after July 2, on the deposit of the sum of £5. The site at Frankley may be inspected by appointment from July 2 to July 6 inclusive. Early application for particulars is necessary, as only a limited number will be given out, and none after July 6. Fair wages clause. Sealed tenders, endorsed "Tender for Works at Frankley," are to be delivered to E. Antony Lees, secy., 44, Broad Street, Birmingham, at or before noon on July 20.

July 24. Thornaby.—Renewal of the superstructure of the bridge carrying the passenger lines over the River Tees near Thornaby, Stockton, and the construction and erection of new steel bridge of five spans, of a total length of about 340 feet, including about 360 tons of steel-work for the North-Eastern Railway. The contract will also include the removal and rebuilding of part of the piers in masonry. Plans may be seen, and specification, detailed quantities, and form of tender obtained on personal application at the office of W. J. Cudworth, the company's engineer, at York. Sealed tenders marked "Tenders for the renewal of Tees bridge, Thornaby" must be sent to the secy. at York, before noon on July 24.

IRON AND STEEL.

July 12. Aldershot.—Manufacture and erection of a steel water tank and substructure, with appurtenances, at the Water Company's Reservoir Grounds, Cargate Hill, Aldershot. Copies of tender, general conditions, and specification may be had on application to the Secretary and General Manager, accompanied by a deposit of £2 2s., and drawings may be inspected at the office of the consulting water engineers, John Taylor, Sons & Santo Crimp, Caxton House, Westminster, S.W. Tenders should be delivered in sealed package, addressed to R. W. Edwards, secretary and general manager, Chief Offices, Victoria Road, Aldershot, on or before July 12, endorsed "Tender for Water Tank."

July 24. Johannesburg.—Supply and delivery of 235 colonial tons of barbed wire, 500 tons of galvanized drawn steel fencing wire, and 62,500 eyebolts. Forms may be obtained from Chief Railway Storekeepers, Germiston, and the Railway Storekeepers, Pretoria and Bloemfontein. Tenders to be sent in by July 24.

PAINTING AND PLUMBING.

June 28. Greenwich.—Painting works to be carried out at the Children's Homes, Sidcup, for the Guardians. Specification and form of tender can be obtained at the Clerk's Office, Union Workhouse, East Greenwich, and must be returned before June 28, on which day the same will be opened at a meeting of the Guardians.

June 28. Salford.—Decorating the whole of the inside of the 38 cottages on the east and west side of the Salford Town Hall. The specification and form of tender can be obtained from the Borough Engineer, Town Hall, Salford. Tenders, endorsed "Tender for Decorating

Cottages," addressed to the Chairman of the Town Halls Committee, to be delivered to L. C. Evans, town clerk, Town Hall, Salford, not later than 10 a.m. on June 28.

June 29. Dewsbury.—Painting of two steel bridges over the River Calder and the Calder Canal, for the Waterworks Board. Specification and form of tender may be obtained and the general conditions seen on application at the Engineer's Office, Town Hall, Dewsbury. Tenders to be sent to H. Ellis, clerk to the Board, Town Hall, Dewsbury, on or before June 29.

June 30. Liverpool.—Painting, colouring, lime-whiting, &c., and works in connection therewith, at the Military Barracks at Manchester, Seaford and Preston, in the Liverpool S.B. District (separate tenders). Persons desiring to tender for the execution of these works must leave their names at the Royal Engineer Office, 14, Elliot Street, Liverpool, on or before June 30, and pay the sum of 10s. for either of the bills of quantities, which, with form of tender, will be issued to each candidate, the amounts not being returned unless the work is abandoned. Any contractor not on the approved list of War Department contractors must furnish with their application satisfactory references from two architects or engineers of their ability to carry out such works.

July 2. Manchester.—Painting the roof of the Smithfield Market. Specification may be obtained at the office of the City Architect, Town Hall, upon payment of £1 rs. Sealed tenders, enclosed in the official envelope, to be delivered at the above office not later than 9 a.m. on July 2.

July 2. Carlisle.—Painting works required to be executed at the Town Clerk's Office, Fisher Street (work to be commenced at the beginning of August). Specifications and full particulars may be obtained from Henry C. Marks, M.I.C.E., city engineer and surveyor, 36, Fisher Street, Carlisle, on payment of 10s. 6d. Sealed tenders, endorsed "Tender for Painting Town Clerk's Office," to be delivered at the Surveyor's Office not later than 10 a.m. on July 2.

July 2. Cardiff.—Painting certain wards, &c., and for the external painting of a portion of the Cardiff Infirmary. Specifications may be obtained at the Secretary's Office at the infirmary. Sealed and endorsed tenders to be delivered to Leonard D. Rea secretary and general superintendent, not later than noon on July 2.

July 3. London, S.E.—Cleaning, decoration and repair of old receiving ward, Elder Road, West Norwood, for the Lambeth Guardians. Tenders, which will be received only on printed forms, sealed and endorsed "Tender for Repairs, Norwood Receiving Ward," must be sent by post to W. Thurnall, clerk, Guardians' Board Room and Offices, Brook Street, Kennington Road, S.E., not later than July 3, and will be opened at the Boardroom at noon on the following day, when all persons tendering, or their authorised agents, must be in attendance. Draft of contract may be inspected at the offices on any day between 10 and 5. Specification and form of tender will be supplied on personal application and on payment of £2 in respect thereof.

July 3. Penrith.—Painting, &c., of the retort house roof. Particulars on application to the Manager at the Gas Works. Sealed tenders, endorsed "Gas Works Painting," must be delivered to George Wainwright, clerk, Town Hall, not later than July 3.

July 6. Warrington.—Painting and cleaning of certain schools. Specifications, forms of tender, and all further information may be obtained at the office of the Borough Surveyor, Town Hall, at which place tenders must be delivered before noon on July 6.

July 7. Hove.—Distemping walls, ceilings, &c., at the Hove Sanatorium, Portslade. Further particulars may be obtained at the office of the borough surveyor, H. H. Scott, Town Hall, Hove. Tenders, on forms supplied, addressed to H. Endacott, town clerk, Hove, endorsed "Tender for Distemping, &c., Sanatorium," will be received up to 2 p.m. on July 7.

July 7. Mistley.—Painting and other work at the Police Station, Mistley, Essex. Specification can be seen at the Police Station upon application to the Inspector. Sealed tenders, endorsed "Tender for Painting, &c., Mistley Police Station," must reach F. Whitmore, county architect, 73, Duke Street, Chelmsford, not later than July 7.

July 7. Southminster.—Painting and other work at the Police Station, Southminster, Essex. Specification can be seen at the Police Station upon application to the Superintendent. Sealed tenders, endorsed "Tender for Painting, &c., Southminster Police Station," must reach Frank Whitmore, county architect, 73, Duke Street, Chelmsford, not later than July 7.

July 11. London, S.W.—Painting, distemping, general repairs, &c., at the Infirmary in the Fulham Road, S.W., and at the Children's Home in Millman's Street, Chelsea, S.W., for the Guardians of St. George's Union. Specifications and all particulars may be obtained from W. Ernest Hazell, A.R.I.B.A., No. 5, Tavistock Square, W.C., between 10 a.m. and 5 p.m. Tenders must be signed, sealed and endorsed "Tenders for Painting, &c., at St. George's Infirmary and Children's Home," and forwarded to Thomas Warlock, clerk to the Guardians, Saint George's (Hanover Square) Hall, Mount Street, W., not later than 11 a.m. on July 11.

July 13. Preston.—Painting, &c., public conveniences in various parts of the borough. Specification, form of tender and all other information may be obtained at the office of the Borough Surveyor, Town Hall, Preston, to whom sealed tenders, endorsed "Tender for Painting, &c., Conveniences," must be delivered not later than noon on July 13. Fair wages clause.

July 13. Preston.—Painting, &c., required throughout the Cattle Market, Brook Street. Specification, form of tender, and all other information may be obtained at the office of the Borough Surveyor, Town Hall, Preston, to whom sealed tenders, endorsed "Tender for Painting, &c., Cattle Market," must be delivered not later than noon on July 13. Fair wages clause.

(Continued on p. 348.)

ARCHITECTS IN NATAL.

Some Interesting Colonial Views.

A SOUTH AFRICAN correspondent sends us a report of the annual meeting of the Natal Institute of Architects held on May 18th at Pietermaritzburg, on which occasion the president, Mr. W. Lucas, F.R.V.I.A., F.R.G.S., delivered his inaugural address. In the history of their institute the past year would, he said, be specially marked for the achievement—in conjunction with the Master-Builders' Association—of a set of conditions of contract which it was hoped would soon prove acceptable to all involved in building operations, and set at rest a number of contentious points that had hitherto prevailed through the use of diverse conditions; it seemed highly probable now that a uniform set throughout South Africa would be secured.

Architects' Registration.

Speaking on architects' registration, in respect of which a pamphlet had been circulated among members of the Natal Government and Legislature, Mr. Lucas said that several leading members of the House had expressed themselves as favourably disposed to such a step, and it behoved them not to slacken efforts towards obtaining such registration, their hopes being that at no distant date the Natal Legislature would have no hesitation in placing the profession on the same footing as law and medicine.

Dealing with the matter of

Competitions.

he said that one of their ideas was the general adoption of a model set of conditions, prepared conjointly by the several South African Institutes, on the lines of those of the Royal Institute of British Architects. The outstanding competition of the year, that for the new Law Courts at Capetown, was, on the whole, eminently satisfactory, though the premier result again emphasized the futility of competing for an important complex city building without an intimate personal knowledge of local conditions dominating the site.

During the present year it was hoped that further steps would be taken towards bringing about closer alliance and ultimate federation of the kindred institutes of South Africa.

South African Architecture.

At the congress of the British Association held at Johannesburg last year papers on "The Training of Architects" and "The Architectural Problem in South Africa" had been read. A plea was put in for a fuller revival of early Cape design, and it was urged that "in all South African practice the main ideas of Classicism and Mediævalism were necessary, whilst a combination of the concentrated insularity of the Anglo-Saxon with the far-seeing daring life of the Dutch, especially in ecclesiastical work, would be of great service to architecture."

It had been rightly said that if only a few leaders of trade in every South African centre were to co-operate with the profession in so far as to be content with plainer buildings in substantial stone or brick—truly architectural works—in preference to tawdry surface displays of cement stucco, overwrought terra-cotta, glass and cast-iron work so prevalent, the tone of architecture would not only be appreciably raised, but with it the tone and true prosperity of commerce.

The Undeveloped Resources of Natal.

A Government report that furnished considerable food for reflection was that of the industries commission. It was a most regrettable fact that many industries which had failed, and others which were now languishing, would, with the aid of technical knowledge, ere this have become established and profitable undertakings. The natural conditions of Natal colony were so favour-

able to the cheap, rapid and effective growth of certain trees supplying marketable woods that a profitable investment stood inviting enterprise in this direction. In close proximity to the railways were deposits of clay suitable not only for the excellent bricks that were produced, but for most if not all descriptions of ornamental bricks, terra-cotta and tiles; while evidence showed that all the cement required for the colony could be manufactured from local deposits. Valuable limes, being worked to a limited extent, only existed in several centres. The plant now in contractors' workshops in the colony was sufficient for the production of joinery, including doors and windows, at such reasonable prices that there was practically no longer any necessity to specify imported goods in this particular. Recent developments in the manufacture of structural metalwork also promised well for architecture, and to learn that the steelwork for the roof of the new town hall at Durban was being prepared in the colony was most gratifying.

So far there had been practically

No Encouragement

in South Africa (compared with that given by other colonies) to establish industries allied with the building trades. In fact, it appeared that industries as a whole owed little to former Governments. Mr. Lucas thought, however, it was clear that as the result of this commission's arduous labour, linked with the influence of the Master-Builders' Federation, some of the anomalies of the past as to the relative duties on imported rough and manufactured timber, to the great gain of the latter, would be removed at an early date, and that conditions would prevail to enable local productions to compete favourably with imported articles.

Conciliation Boards.

The inauguration of conciliation boards in preference to the promotion of Compulsory Arbitration Bills was to be commended. Already boards were in working order at Capetown and Durban. Another movement that particularly commended itself was the recent formation of an assurance company to primarily safeguard builders' risks. This was having the support of the trade at the Cape, and was under consideration by Natal. A further excellent idea was the forwarding of official monthly trade reports to colonies outside South Africa.

Quantities.

Owing to the unsettled state of the law in reference to quantities, Mr. Lucas said he was not prepared to advocate architects taking out their own, nor was he keen on their supply by quantity surveyors, unless fully guaranteed by the latter, the ideal of course being quantities forming the basis of the contract. A growing custom which as architects they ought to combat was for proprietors to supply material—either direct or through the architect—aiming at everything relating to the contract passing through the contractors' hands, with the exception of peculiarly specialist work. Many architects did not realize the legal risks to which they exposed themselves by indenting, or in anywise ordering, any materials on behalf of a client under a building contract, whether specified as prime cost or as conditional to a contract.

Tenders.

On the question of tenders received, he believed that any advantage in the publication of other than the accepted tender was far outweighed by the disadvantages. For some years the Master-Builders' Association of Melbourne—representing one of the most powerful and extensive of building interests—had upon this point held the reverse view to that of the Federated Builders of South Africa, with the result that last year, owing to the request of that Association that the Royal Victorian Institute of Architects should more fully give

their wishes favourable consideration, that Institute as a body did not divulge any but the accepted tender.

The Architect in Being.

As an architect was not called upon to be a walking encyclopædia, the sooner the teaching of those who claimed that to be efficient to practise one should reach an obviously unattainable standard—the sooner this was ignored the better for the profession. We needed less of the academic of the schools and more concentration on the germ idea of the building in hand; less of detail and fuller touch—at the expense of detail—with the primary *motif* of classification; less time in making the mind a storehouse of historical facts and more passionate readiness for emergencies; less pencilling at the drawing board, and more brooding with closed eyes over the bases of expression; less striving after mechanical perfection, and more encouraging of initiative in office and workshop: always remembering, as "Punch" had said, that an architect's best friend was his india-rubber.

Mr. Lucas said he was old enough to know that the virility of the work of Belcher and of Hare, the dash of that of Lanchester and Rickards, the formal stateliness of Webb and Bell, the vim of Norman Shaw, and the charm of Gilbert Scott the youngest—all found source and inspiration to a large degree in the work of pioneers who, beyond supplying the professional press with an occasional illustration and the erection of a modest structure, left practically no outstanding examples of their genius.

PROJECTING SHOPS.

Protest against the Building Act Clauses.

A PUBLIC meeting was held recently at St. Pancras Town Hall to protest against clauses 10 and 12 of the London Building Acts Amendment Act, 1905, relating to projecting shops.

Mr. H. D. Widdicombe said their objection was to the application of the obnoxious clauses to existing premises, because they as owners or occupiers had no part or lot in determining the material of which such premises were constructed. They either found them as they were, or built them to the requirements of the then existing public authority. In either case they did so in the belief that after a bargain had been entered upon, that bargain, so long as it was not unconscionable or contrary to public policy, should stand. In St. Pancras there were 700 projecting shops affected by the Act.

Under Section 10

any building with an extension of more than 7ft. was required to have a roof of fire-resisting material; not only that, but the fire-resisting material must be jins. thick: and any lantern light or ventilating cowl was to be removed to not less than 6ft. from the main front of the building, and carried up on its three inner sides in fire-resisting material. The cost of this work in each case would amount to an average of about £60. In addition there was the serious inconvenience caused while the work was being carried out—quite three weeks. Again, the removal of lantern lights to a distance of 6ft. from the main front of the building meant that the shop parlour or room in the main building on a level with the shop would be in a state of perpetual gloom, in the Cimmerian darkness of which the shop-keeper or his assistant would have to enter up on the wrong side of the ledger the cost of extra illumination—another item which made the payment for this protection much too heavy to be borne.

Some Facts and Figures.

Sir William Collins, M.P., L.C.C., said that at the time the Bill was before Parliament it was pointed out that in London,

between 1895 and 1905, there were thirty-three lives endangered and twenty-four lives lost by the want of such a provision in shops as was now required. These cases had arisen in Ben Jonson Street, Stepney, and in the Hackney Road, and it was deplorable instances of that sort that had suggested to the Building Acts Committee of the County Council to go to Parliament for legislation. So far as he could remember, the draft Bill dealt with new shops, and it was not until the retrospective element was introduced that hostility was aroused in regard to what the owners of existing projecting premises thought was a grievance, so far as they were concerned. There was power given under clause 10 to appeal to the Tribunal of Appeal, and while that was something within the means of large owners, the provision did not seem equally useful with regard to the interests of the small shopkeepers. He had enquired about clause 10 at the Council, and was informed that, up to May 28th, 6,234 notifications had been received, 4,094 of which related to shop fronts. The Building Acts Committee in the notices they had sent out called special attention to the London County Council's

Powers of Exemption

under the Act. Under these powers the Council was empowered in reasonable cases to exempt; and further, the Council was desirous that the Act should be worked with as little inconvenience as possible. Words to that effect were contained in the notices sent out. He was informed that 366 applications for exemptions had been already received. Where no case had been made out for total exemption, partial exemption had been allowed, provided certain alterations were carried out rendering a portion of the roof fire-resisting, and providing means of escape on to adjoining premises or access to the roof itself. No doubt alterations of that kind, or some of them, might be less costly than the original requirements. In 154 of the applications for total exemption, sixty-one had so far been partially exempted, fifty-eight refused and thirty-five exempted. His own idea was to endeavour to get the County Council to take a large view of their exemption powers rather than to go for an amendment of the law which was in the dim and distant future.

A resolution was carried protesting against the sections, and appealing to the London County Council for the amendment or abolition of them.

Notes and News.

Mr. David W. B. Haining, architect, Falkirk, has been appointed assistant borough surveyor of that town.

The Programme of the 7th International Congress of Architects, to be held in London next month, has been issued. H.R.H. Princess Louise will attend, and the Duke of Argyll will take the chair at the inaugural meeting at the Guildhall on July 16th. There will be about 500 foreign delegates.

A large new Drapery Store in Princes Street, Edinburgh, is to be built from designs by Messrs. John Burnet & Son, architects, of Glasgow. Skeleton steel construction will be adopted. A corner tower rising to a height of 127ft. 6ins. will be a feature of the building, which will comprise seven floors. White freestone is the building material.

The Royal Prince's Parade at Bridlington has been extended northwards, and on the extension a pavilion capable of seating 1,600 persons has been erected. The sea wall has been continued further north, and the old wooden terraces replaced in stone. These works have cost £40,000. They are to be officially opened by the Lord Mayor of London on July 6th.

"CARSTONE", HUNSTANTON.
FOR MISS LUCAS.
H.C. IBBERTSON ARCHT. 28 MARTINS LANE EC
The walls of this house are of a local stone known as Car, rich brown in colour, left rough and with large stones at the angles. Rough-cast is used on the bay and chimneys. The roof is of red tiles, and the woodwork painted green. The work was carried out by Messrs. George Chambers & Son, of Snettisham, Norfolk, at a cost of £762 10s. The decorative leadwork was designed and worked by the architect.

At the "Country in Town" Exhibition, to be opened by H.R.H. Princess Christian in the Whitechapel Art Gallery on July 5th, there will be exhibited plans for beautifying crowded areas in London. The exhibition will be open until July 19th. Admission will be free.

New Council Schools at Wisbey have been erected at a cost of £20,546, accommodation being provided for 360 boys, 306 girls and 206 infants—total 926. The architect was the late Mr. William Vaughan, and the clerk of works Mr. James Drake, M.I.C.W.A. The heating and ventilation has been carried out by Messrs. Ashwell & Nesbit, of Leicester.

Mr. R. S. Lorimer, A.R.S.A., of Edinburgh, who has charge of the restoration of the late Sir Charles Tennant's mansion "The Glen," in Peeblesshire, hopes to have it ready in the autumn. Internally, the arrangements have been largely modernized, and the hall and staircase have been thrown into one by a handsome stone arcade.

A Big Stained-glass Window.—From the designs of Mr. J. Eadie Reid, the Gateshead Stained-Glass Co., Ltd., have just completed what is considered to be one of the largest one-light windows ever made in the North. It measures 14ft. by 6ft. and weighs about three-quarters of a ton, 100 sq. ft. of glass being used in its manufacture. The subject is the Ascension.

The Anglo-Saxon Church of Corhampton, situated on the picturesque banks of the River Meon, has just been repaired and restored, at a cost of £800, under the superintendence of Mr. T. G. Jackson, R.A. The Saxon chancel arch has been strengthened; the bell-cote, dating from 1600, reconstructed; the bells, dated 1619 and 1829, rehung; and the Saxon west window opened.

Messrs. Sheen & Wells, heating engineers, of Sheffield, have received instructions to fix their improved small-pipe hot-water heating apparatus in Long Clawson Parish Church, near Melton Mowbray.

Additional Poor-Law Buildings.—Despite protests from several quarters, the St. George's (Hanover Square) Board of Guardians are proceeding with their scheme for the erection of a new board-room, offices and extensions of the workhouse in Wallis's Yard, Buckingham Palace Road. Mr. Francis G. Smith, F.R.I.B.A., is architect for the buildings, tenders for which are now being invited. It is estimated the preliminary outlay will be about £25,000.

Bitumastic Enamel.—Nearly the whole of the interior surfaces of the double bottom fore and aft of the new Cunarder "Lusitania" has been coated with Messrs. Wailes, Dove & Co.'s patent bitumastic enamel, also the bilges and interior surfaces of bunkers. The tank tops in turbine, boiler and machinery spaces have been coated with patent "bitumastic" covering. The total area of surfaces coated by Messrs. Wailes, Dove & Co. is about 620,000 sq. ft.

A Model Colliery Village is to be erected at Bentley, near Doncaster, for Messrs. Barber, Walker & Co., of Eastwood, Notts., under the direction of Mr. E. Hall-Ballan, M.S.A., of Doncaster, architect to the company. The familiar "pit rows" and unsightly conveniences are to be dispensed with. The cottages will be built in separate blocks of not more than four, and each cottage will have its own private conveniences and garden at front and rear. It is intended that the overcrowding, so common in mining centres, is to be in this case entirely avoided.

CONTRACT LIST (continued from p. 345).

July 16. Ipswich.—*Painting and decorating work* to be done at all or any of the following Council schools during the August holidays:—Outside painting: London Road Girls' and Infants', St. Mary Elms Boys', Cavendish Street Boys', Nacton Road Mixed. Inside cleaning, colouring and whitewashing: Westerfield (including teachers' house), Whitton (including teachers' house), Trinity Street Girls' and Infants', Springfield Boys', Girls', and Infants' (excluding new classrooms). A copy of the specification and any further particulars may be obtained on application to E. T. Johns, Tower Chambers, Tower Street, Ipswich. The price for each school must be stated separately. Fair wages clause. Tenders, plainly endorsed "Tender for August Work," must be delivered to J. Hepburn Hume, secy., Education Committee's Offices, Tower House, Tower Street, Ipswich, between 10 and 12 noon on July 16.

ROADS AND CARTAGE.

June 28. Ashford.—*Road metal*, for the U.D.C. Supply of 2,060 cub. yds. (more or less) of zin. gauge broken granite, &c., as per form of tender, to be obtained from W. Terrell, surveyor, North Street, Ashford, Kent, to whom sealed tenders, with samples, are to be sent not later than 5 p.m. on June 28, endorsed "Tender for Granite."

June 30. Northwood.—*Laying of new kerb* in Church Road, Northwood, for the U.D.C. Forms of tenders and full particulars may be obtained from W. Louis Carr, surveyor, Council Offices, R.S.O., Northwood, Middlesex. Tenders, properly endorsed, are to be delivered to Edmund R. Abbott, clerk, Northwood, R.S.O., Middlesex, not later than June 30.

June 30. Truro.—*Steam rolling*, for the R.D.C. The district is divided into two divisions, and there are about 225 days' rolling required in one division and about 144 in the other. Two rollers (10 or 12 tons) must be kept constantly at work in each division from Nov. 1, 1906, until the work is completed. Tenders are required for the rolling in both or either of the divisions, and they should state price per working day of eight hours for each roller, including driver, flagman and everything necessary (except only horses and drivers for water-carts). For further information apply as to the North Division to John Retallack, surveyor, Ventongimps, Callestick, S.O., and as to the South Division to James P. Carbis, surveyor, Ruan High Lane, Grampond Road. Tenders are to be sent to G. C. Hancock, clerk, St. Agnes, Cornwall, on or before June 30.

July 2. Wisbech.—*Supply of highway materials*, including granite, granite chips, granite dust, double-sifted gravel, footpath gravel, coarse sand, zin. broken stone, clunch and Portland cement. For particulars and forms of tender apply to the Borough Surveyor, Exchange Square, Wisbech, to whom samples should be sent. Sealed tenders to be delivered to C. E. F. Copeman, town clerk, Wisbech, not later than 10 a.m. on July 2.

July 2. London, N.—*Making-up* of Station Avenue, Winchmore Hill, and Broomfield Avenue and part of Osborne Road, Palmers Green, within the Council's district. Plans may be seen on application to the Council's surveyor, Charles G. Lawson, from whom copies of the specification and forms of tender may be obtained on depositing £2 in cash. Tenders, endorsed "Private Streets," must reach W. M. Ellenor, clerk of the Council, Council Offices, Palmers Green, N., not later than July 2.

July 2. Bollington.—*Supply of about 300 tons of zin. Welsh granite macadam*, and for a quantity of zin. Welsh granite macadam and chippings, to be delivered at the Bollington railway station for the U.D.C. Tenders, endorsed "Macadam," to be sent in so as to reach Samuel Knight, clerk, Council Offices, Bollington, near Macclesfield, not later than 5 p.m. on July 2.

July 2. Urmston.—*Flagging and kerbing* of the footways of Station Bridge, Urmston, and its approaches for the U.D.C. Plans, specifications, and forms of tender may be obtained from James Heath, surveyor to the Council. Sealed tenders must be delivered to T. J. Rowland, clerk to the Council, Council Offices, Urmston, not later than 4 p.m. on July 2.

July 2. Wakefield.—*Supply and delivery of granite or Whinstone setts and macadam*. Forms of tender and any other information may be obtained from the City Surveyor, Wakefield. Tenders, sealed and properly endorsed, must be sent to W. Greenhalgh, town clerk, Town Hall, Wakefield, not later than 9 a.m. on July 2.

July 3. London, S.E.—*Supply of 200 tons of waste and broken pieces of Jersey or Guernsey granite*, for breaking, to be delivered at the stoneyard in Wincott Street, Kennington Road, S.E., for the Lambeth Guardians, having first been weighed by the contractor at the weigh-bridge of the workhouse in Renfrew Road. Tenders, with full specification, including name of quarry, must be sent to W. Thurnall, clerk, Guardians' board room and offices, Brook Street, Kennington, S.E., sealed and superscribed "Tender for Granite," on or before July 3, and will be opened at the Board Room on July 4. A small sample of the stone to be supplied should be sent.

July 3. Edinburgh.—*Work on the carriageways of:* (1) Esslemont Road, (2) Granby Road, (3) Abercorn Road, (4) Willowbrae Avenue, (5) Westfield Avenue, (6) Plewlands Terrace, (7) Craiglockhart Terrace, (8) Shandon Terrace, (9) Shandon Crescent, (10) Shandon Road—macadamising; (11) West Park Place, (12) West Newington Place, (13) lane at Ethel Terrace—concrete; and for granolithic work on the footways of (1) Esslemont Road, (2) Granby Road, (3) Abercorn Road, (4) Willowbrae Avenue, (5) Westfield Avenue, (6) Plewlands Terrace, (7) Craiglockhart Terrace, (8) Shandon Road; also for widening at Western Terrace. Schedules of quantities and specifications may be obtained on application to the City Road Surveyor, City Chambers. Tenders, sealed within the official envelopes supplied, must be lodged with Thomas Hunter, W.S., town clerk, City Chambers, Edinburgh, by 5 p.m. on July 3.

July 4. Tadcaster.—*Macadamising, kerbing, channelling* (and asphalt footpaths on front streets), for the under-mentioned private streets, situate at Crossgate, in

the Parish of Barwick-in-Elmet, Marshall Terrace, Back Marshall Terrace, Marshall Street, Back Marshall Street, Back Austhorpe Lane, and a portion of Back Austhorpe Road, between Back Marshall Place and Austhorpe Road; together having a length of about 1,200 lin. yds. Plans, sections, and specification may be inspected at the office of Spinks & Pilling, engineers and surveyors, 28, Park Row, Leeds, from whom bills of quantities and form of tender may be obtained on payment of £2 2s. Sealed tenders, endorsed "Private Street Works Tender," to be sent to Geo. A. Bromet, clerk, Council Offices, Tadcaster, not later than July 4.

July 4. Middleton.—*Private street improvements*, in Egerton Street, Wilton Street, Walker Street, and Church Street (Rhodes). Specification, quantities and form of tender (which contains a fair-wages clause) may be obtained and plans may be seen on application to the Borough Surveyor, between 9.30 and 10.30 a.m., and on payment of a deposit of 10s. 6d. Tenders, addressed to the chairman of the surveyor's committee, endorsed "Tender for Street Works," are to be delivered at the Town Hall on or before July 4.

July 4. London, N.—*Paving with compressed asphalt* part of Stroud Green Road, Hornsea. Forms of tender, &c., and particulars can be obtained from E. J. Lovegrove, borough engineer and surveyor, Municipal Offices, No. 99, Southwood Lane, Highgate, on any morning between 10 and 12. Tenders must be on the prescribed form and be delivered or sent by post (sealed and endorsed) so as to be received in the Town Clerk's Office by 4 p.m. on July 4. Schedules, duly completed, must accompany the tenders.

July 4. Hove.—*Executing paving and other works* in Wilbury Villas (between north end of Railway Bridge and Old Shoreham Road). Further particulars may be obtained, and plans and specifications seen, at the office of the borough surveyor, H. H. Scott. Tenders, on forms supplied, addressed to H. Endacott, town clerk, Town Hall, Hove, and endorsed "Tender for Wilbury Villas," will be received up to 6 p.m. on July 4.

July 4. Chester-le-Street.—*Making-up* the following private streets:—Prospect Street (back), Prospect Street (front), Prospect Terrace (back), west ends of Prospect Street and Prospect Terrace, Villiers Place, Lucy Street (front), West View (front), Morningside Terrace (back), Ashley Terrace (front), Lambton Terrace (back), North Burns, Nicholson's Buildings Road, concrete retaining wall and fencing for ditto. Plans, sections and specification may be seen and schedule of quantities, together with form of tender, obtained at the Highway Surveyor's Office any day between 9 a.m. and 5 p.m. The surveyor will go over the streets any time by arrangement with persons wishing to tender. Sealed tenders, endorsed "Tender for Private Street Works," to be delivered to G. W. Ayton, highway surveyor, Chester-le-Street, not later than July 4.

July 9. Beckenham.—*Widening of Bromley Road* (The Knoll) for a length of 300 ft. The works consist of about 1,500 cub. yds. excavation, 70 cub. yds. concrete, 5 rods gault brickwork, 300 lin. ft. channelling, 500 sq. yds. red-brick paving, together with the remodelling and flinting of 100 lin. yds. of roadway. Plans and sections may be seen and bills of quantities, specifications and forms of tender obtained on application to John A. Angell, surveyor, on the production of a receipt from the Collector (who attends his office daily from 9 to 10 a.m. only, except on Tuesdays, when his hours are from 9 a.m. to 1 p.m.) for a deposit of £1. A clause will be inserted in the contract providing that the contractor shall (1) pay to the workmen employed in the execution of the work the wages generally accepted as current for workmen engaged in similar work in the district; and (2) to the extent of 75 per cent. at least of the staff required in the execution of such works, give preference to, and engage such competent workmen of the class required as may be bona-fide residents in the parish of Beckenham and may offer themselves for employment. Tenders, duly sealed and endorsed "Tenders for Bromley Road Widening," to reach undersigned not later than 4 p.m. on July 9. The Council do not bind themselves to accept the lowest or any tender.

July 10. Mountain Ash.—*Execution of public street improvements* in Bush Road, Mislain, for the U.D.C. Specification and plans and sections may be seen and forms of tender and bills of quantities may be obtained on application to W. C. Thomas, surveyor to the Council, Town Hall, Mountain Ash. Sealed tenders, prepaid, and endorsed "Bush Road," to be sent to H. P. Linton, clerk to the Council, Town Hall, Mountain Ash, by 9 a.m. on July 10.

July 10. Ottery St. Mary.—*Construction of a new footpath over St. Saviour's bridge*, Ottery St. Mary, to the railway station, being a continuation of the present footpath, and about 498 feet in length. The plans, specification, and form of contract can be seen at the office of the County Council, at the Castle of Exeter, where tenders are to be sent on or before July 10.

July 13. Preston.—*Levelling, paving, flagging, channelling, &c.*, Elijah Street, Tweed Street, Mona Street and Shelley Road. Plans, section and specifications may be seen and schedule of quantities and form of tender obtained at the offices of the Borough Surveyor, Town Hall, Preston, to whom sealed tenders, endorsed "Tender for Paving, &c.," must be delivered not later than noon on July 13.

July 14. Hastings.—*Cartage* of 300 yds. of unbroken stone from their quarry at Gatehurst Farm, Pett, to various places in the district, for the R.D.C. Forms of tender, which only can be received, may be obtained from the district surveyor, D. Paine, Stonelynk Farm, Fairlight, Hastings. Tenders to be forwarded to Arthur R. Inskip, clerk, 11, Wellington Square, Hastings, not later than July 14.

July 14. Stretford.—*Paving*, with granited rock, asphalt, &c., the following streets for the U.D.C.:—Wesley Street, Burleigh Street, North Lonsdale Street, Powell Street, Alphonus Street. The drawings and specification may be seen and forms of tender, with schedule of quantities and other particulars, obtained on application to Ernest Worrall, surveyor, any day during office hours on payment of a deposit by cheque of £2 2s. Sealed tenders,

endorsed "Private Streets Works," addressed to the Chairman of Highways, are due at the Council Offices, Old Trafford, by July 14.

SANITARY.

June 28. Thrapston.—*Construction of three small septic tanks, and laying about 280 yds. of 4 in. outfall pipes* to Irrigation Land. The drawings and specifications may be seen at the Office of the Clerk to the Rural District Council at Thrapston, where copies of the quantities may be obtained on payment of 5s. Sealed tenders, endorsed "Denford Sewage Disposal," must be delivered to Gerald Hunnybun, clerk to the Council, Rural District Council Office, Thrapston, on or before June 28.

June 28. Penycroft.—*Providing and laying* about 210 lin. yds. of 6 ins. diameter stoneware and cast-iron pipe sewers, about 1,130 lin. yds. of 6 ins. diameter stoneware pipe sewers and effluent carriers, the erection of a bacterial filter, sewage distributing outlets, manholes, lampholes, flushing tanks, ventilating columns and other appurtenant works, for the Llantrisant and Llantwit Fardre R.D.C., in connection with the sewerage of Penycroft. Drawings and specification may be seen on application to Gomer S. Morgan, surveyor, School Street, Pontyclun, from whom bill of quantities and form of tender may be obtained, on or before June 22 upon payment of £1. The Surveyor will meet the contractors on the ground at 1 p.m. on June 22. Tenders must be delivered to W. Spickett, clerk to the Council, before 10 a.m. on June 28.

June 29. Walthamstow.—*Erection of an underground convenience* adjoining the Public Baths, High Street, in accordance with plans and specifications which may be inspected at the office of G. W. Holmes, A.M.I.C.E., engineer to the Council, on and after June 19. Forms of tender may be obtained by previously depositing in cash the sum of £3 3s. Sealed tenders, upon the forms supplied, addressed to C. Sydney Watson, clerk to the Council, Town Hall, Walthamstow, and endorsed "Tender for Underground Convenience," must be delivered not later than 5 p.m. on June 29.

June 29. Matlock.—*Supply of the following pipes* during July, August and September, for the North Darley U.D.C., 50 yds. of 6 in. best glazed pipes; 1,300 yds. of 9 in. best glazed pipes; 300 yds. of 12 in. best glazed pipes. Also various bends and junctions. Forms of tender may be obtained from the Surveyor. Tenders, endorsed "Tender for Pipes," are to reach the office of F. C. Lynn, solicitor, Matlock, Bath, by June 29.

July 1. Hexham.—*Taking up certain old sewers and drains and laying about 1,300 yds. of 6 in., 9 in. and 12 in. pipe sewers with manholes, lamp-holes, flushing chambers and house connections complete* at Prudhoe, for the R.D.C., in accordance with plans, specifications and particulars prepared by J. E. Parker, A.M.I.C.E., Post-office Chambers, Newcastle-on-Tyne, from whom quantities can be obtained on depositing £1 1s. Sealed tenders, marked "Prudhoe Sewerage," to be sent to J. H. Nicholson, clerk, Hexham, not later than July 1.

July 2. Settle.—*Construction of about 585 lineal yds. of 9 in. internal diameter earthenware and cast-iron pipe sewers*, together with necessary manholes, inspecting shafts, ventilators, &c., for the R.D.C. The drawings, specifications and conditions may be seen and bills of quantities obtained at the offices of the engineers, Barber, Hopkinson & Co., Craven Bank Chambers, Keighley, on payment of £1 1s. Sealed tender, endorsed "Giggleswick Outfall Sewer," and on the form provided, to be delivered to T. E. Pearson, clerk to the Council, Town Hall, Settle, not later than noon on July 2.

July 2. Birmingham.—*Provision and construction of the following foul water sewers and drains* for the Yardley R.D.C.:—1,803 yds. of .8 in. sewer, including 489 yds. in tunnel; 64 yds. of 12 in. sewer; 1,112 yds. of 9 in. sewer; and 59 yds. of 6 in. sewer. Also the relaying and reconnection of house drains, together with manholes, flushing chambers, and other works appertaining thereto, in accordance with plans, drawings, specification, and conditions of contract, which may be seen on application to the engineer and surveyor, Arthur W. Smith, Council House, Sparkhill, near Birmingham, between 10 and 1 and 3 and 5 (Saturdays, 10 and 1). Specification, bill of quantities, and form of tender can be obtained on payment of £3 3s. Fair wages clause. Tenders, endorsed "Tusley Sewerage," to be addressed and delivered to Francis Ladbury Thompson, clerk of the Council, The Council House, Sparkhill, near Birmingham, not later than noon on July 2.

July 3. Salford.—*Sewering, paving and completing* of certain streets in the borough. The plans and specifications may be seen and forms of tender, with quantities, obtained at the Borough Engineer's Office. Tenders, endorsed "Paving Streets," addressed to the Chairman of the Highway Committee, must be delivered to L. C. Evans, town clerk, Town Hall, Salford, not later than 10 a.m. on July 3.

July 3. Hipperholme.—*Construction of main pipe sewers*, 2,674 yds. in length, for the drainage of the Syke Lane Valley, Hipperholme, together with the necessary manholes, stormwater overflow chambers, and other appurtenant work. Plans and specifications may be seen and forms of tender obtained at the office of Frank Massie, M.I.C.E., Teley House, Kirkgate, Wakefield, on and after June 22, on payment of £2 2s. Tenders, fully priced out, endorsed "Tender for Syke Lane Drainage," to be delivered to E. H. Hill, clerk to the said Council, Council Offices, Hipperholme, not later than noon on July 3.

July 3. Bedford.—*For the following works*:—(1) The construction of an underground sewage pumping station, including storage tank, engine-room, &c., complete at the Bedford Park; (2) the laying and completing of cast-iron and glazed pipe surface-water sewers in the Amphill Road district, including the construction of manholes, lampholes, &c.; (3) the construction and completing of a brick outfall sewer, together with all manholes, lampholes, and necessary alterations to existing pumping station. Full particulars may be obtained upon application to N. Greenshields, A.M.I.C.E., borough engineer, Town Hall, Bedford. Sealed tenders, endorsed (1) "Sewage Pumping Station," (2) "Surface-Water Sewers," or (3)

"Outfall Sewer" respectively, and addressed to the Chairman of the Streets and Buildings Committee, Town Hall, Bedford, to be delivered by 9 a.m. on July 3.

July 3. Loughton.—Laying 500ft. run of 3in. and 337ft. run of 12in. storm-water drain, including necessary gulleys, &c. The District Surveyor to the Council will supply all information. Tenders, marked on the outside "Tenders," are to be delivered to J. H. Hayward, clerk to the Council, Council Offices, Loughton, Essex, on or before 4 p.m. on June 2.

July 4. London, W.—Construction of underground convenience adjoining Uxbridge Road and within Kensington Gardens. Conditions, specification, bills of quantities, and form of tender will be furnished when ready upon application to E. B. B. Newton, A.M.I.C.E., F.S.I., borough surveyor, Town Hall, Paddington, and payment of £1 for a set of documents. Any further information may be obtained, and drawings seen, at the Borough Surveyor's Office, Town Hall, between 10 to 4 (Saturdays, 10 a.m. and 1 p.m.). Tenders must be sent in sealed and endorsed "Convenience," directed to A. W. J. Russell, town clerk, Town Hall, Paddington, W., and delivered not later than Saturday, July 14 after which no tender will be received. The Council do not pledge themselves to accept the lowest or any tender.

July 7. Glasgow.—Construction of sewer No. 1 (Contract No. 2), extending from a point in Paisley Road, south of Ibrox Station, to a point in Saint Andrew's Drive, west of Shields Road. Plans, specifications and working drawings may be seen and specifications and schedules of quantities and forms obtained on application to the City Engineer, at his office, City Chambers, 64, Cochrane Street, Glasgow, on payment of a fee of £5 5s. Sealed offers, marked outside "Tender for Sewer No. 1 (Contract No. 2)," must be lodged with A. W. Myles, town clerk, City Chambers, Glasgow, not later than July 7.

July 7. Horwich.—Drain tiles required for No. 11 bacteria beds, 60ft. in diameter, for the U.D.C. Plans may be seen and the necessary information obtained from the engineer, Mr. H. L. Hinnell, M.I.C.E., of 41, Corporation Street, Manchester. Sealed tenders, endorsed "Drain Tiles," together with samples of the tiles, to be delivered to Peter Taberner, clerk to the Council, Council Offices, Horwich, not later than July 7.

July 7. Horwich.—No. 11 sprinklers, fittings, &c., for bacteria beds, 60ft. in diameter, required at their sewage-disposal works, for the U.D.C. Plans may be seen and full particulars and specification obtained at the office of the engineer, H. H. Hinnell, M.I.C.E., of 41, Corporation Street, Manchester, upon a deposit of £1. Sealed tenders, endorsed "Sprinklers," must be delivered to Peter Taberner, clerk to the Council, Council Offices, Horwich.

July 9. Tavistock.—Works of sewerage and sewage-disposal, including the providing and laying of stoneware and cast-iron sewers and the construction of sedimentation tanks, manholes, &c., Tavistock. Drawings may be seen and copies of the specification, bill of quantities, and form of tender obtained at the office of the engineer, John Chadwick, F.G.S., Bletchley, Bucks, upon payment of a deposit of £3 3s. A duplicate set of drawings may also be seen at the Surveyor's Offices, Tavistock. Sealed tenders, on the prescribed forms, endorsed "Tender for Sewage Works," must be received at the office of W. W. Mathews, clerk to the Council, Council Offices, Tavistock, not later than noon on July 9.

July 9. Runcorn.—Construction of new sewerage works in the parish of Walton Inferior. The works will comprise stoneware pipe sewers, together with all manholes, lampholes and other appurtenances. Drawings and specifications may be seen and quantities, form of tender and all other particulars obtained on application at the offices of James Diggle & Son, civil engineers, Hind Hill Street, Heywood, and 14, Victoria Street, Westminster, S.W., on and after June 23, on payment of a sum of £2. The plans may also be seen at the office of G. F. Ashton, clerk, 71, High Street, Runcorn, to whom sealed tenders, endorsed "Tender for Walton Inferior Sewerage Works," are to be sent not later than July 9.

July 10. Clacton-on-Sea.—Construction of 842 yds of 30in. diameter circular brick storm relief sewer from Clacton-on-Sea, with 24in. iron pipe sea outfall 70 yds. long, and 1,184 yds. of 15in. stoneware pipe stormwater relief sewer from Great Clacton, with all appurtenant works, for the U.D.C. The plans may be seen and quantities and form of tender obtained at the office of the engineer, W. H. Radford, C.E., Albion Chambers, King Street, Nottingham, on deposit of £3 3s. A copy of the plans may also be seen at the Surveyor's Office, Town

Hall, Clacton-on-Sea. Sealed and endorsed tenders must be sent in to G. T. Lewis, clerk to the Council, Town Hall Buildings, Clacton-on-Sea, on or before July 10.

MISCELLANEOUS.

June 28. London, E.C.—Supply of the following stores for the Great Indian Peninsula Railway Co.:—Lifting jacks, &c.; brass and iron screws and split pins; signal wire strand; galvanized W.I. water tubes; galvanized buckets, pans, &c.; turpentine; white lead. Specifications and forms of tender may be obtained at the office on payment of the fee for the specification, which payment will not be returned. Tenders must be delivered in sealed envelopes addressed to J. I. Berry, secy., Company's offices, 48, Cophall Avenue, E.C., marked "Tender for Lifting Jacks, &c." or as the case may be, not later than 11 a.m. on June 28.

June 30. Felling.—For the following works at Wardley School:—Forming of heating chamber and hot water apparatus; repair of playground, and walls, &c., and drainage of west playground. Plans and specification may be seen any morning between 9.30 and 10.30 at the office of H. Miller, architect, Council Buildings, Felling. Sealed tenders, endorsed "Tender for Heating" or "Tender for Repairs," much reach G. Bolam, clerk to the Education Committee, Council Buildings, Felling, R.S.O., co. Durham, not later than June 30.

June 30. Rotherham.—Supply of the following stores and materials required by the Tramways Department during the twelve months ending August 31, 1907:—Oils and grease; tools, hardwood, brake blocks; cast-iron brake blocks; paints and varnishes; brass castings; nuts, bolts and screws; river sand, &c. Forms of tenders, specification and further particulars can be obtained upon application to the Tramways Manager, Tram Depot, Rotherham. Fair wages clause. Tenders, endorsed "Tramways Stores," to be sent to W. J. Board, town clerk, Town Hall, Rotherham, not later than June 30.

July 2. Atherstone.—Draining, fencing, and laying-out of cemetery, for the Parish Council as follows:—(1) for draining; (2) for the supply of unlimbable iron fencing and gate; (3) for laying-out the land and fixing fencing. Plan and specification may be seen on application to J. J. Ryan, engineer and surveyor, North Street, Atherstone, and tenders endorsed "Tender for Cemetery Extension," must be received by W. A. Hatton, clerk, Atherstone, not later than 6 p.m. on July 2.

July 4. Colchester.—Supply of cleaning, &c., materials, to all the Public Elementary Schools in the borough for the period ending 31st August 1907. Schedules of the materials may be obtained and samples of some of the articles required may be seen at the office of the Education Committee. Tenders, under seal, and endorsed "Tender for Cleaning, &c., Materials," must be delivered to Ernest H. Bultitude, clerk, Education Offices, 8, East Stockwell Street, Colchester, not later than July 4.

Partnerships.

Dissolutions of Partnerships.

[The date when the partnership was dissolved is given in parenthesis where known.]

A. & G. BROWN, builders and contractors, Derby. (June 1.) Debts by A. Brown.

J. ROBBINS, J. JOHNSON & T. S. T. TREGELLAS, builders, contractors, &c., London. (Feb. 14.) J. Robbins and J. Johnson continue.

L. NICHOLLS & G. P. TELFORD, masonry contractors and builders' merchants, Newcastle-upon-Tyne. (May 21.) Debts by L. Nicholls, who continues.

Trade and Craft.

New Asbestos-Cement Slates and Slabs.

We are now all familiar with the various products of asbestos and Portland cement made in the form of slabs for wall and ceiling covering. These products have also been used and suggested for roofing purposes. To make a good slate, however, the slabs need be of great tenacity and hardness. The insurance companies admit their fire-resistance, and in this respect they are superior to ordinary slates. Their lightness is of course another factor in their favour. Such roofs, too, conduct much less heat from the sun than slates or corrugated iron, while their faces are smooth, and consequently lay flatter on the roof. Economy is also effected in several ways, namely, freight, labour in laying, roof timbers and speed of erection. We have recently received samples of an asbestos-cement slate recently put on the market, which seems to possess many good qualities, and yet to avoid the dangers of shortness, porosity and liability to deteriorate. The tensile strength of "Eternit" slates, as they are called, is 5,781 lbs. to the sq. in.; their resistance to crushing is 8,281 lbs. per sq. in. It is claimed, therefore, that they have 30 per cent. greater strength than Bangor slates. They are also 65 to 70 per cent. lighter, because "Eternit" roofs average 21 lbs. per sq. yd., with 2 $\frac{3}{4}$ in. lap, whilst Welsh slates average 67 lbs. and red tiles 80 lbs. One thousand "Eternit" diagonal slates (style C), 15 $\frac{1}{2}$ ins. by 15 $\frac{1}{4}$ ins., with a 2 $\frac{3}{4}$ in. lap, cover a roof area of 132 sq. yds., or about 12 squares. The slates are made in three colours—grey, blue and terra-cotta—all of which are warranted unfading. "Eternit" sheets are also made for walls and ceilings. Their size is 99ins. by 47 $\frac{1}{2}$ ins. by $\frac{1}{8}$ in. thick and upwards. "Eternit" slates are manufactured under Ludwig Hatschek's patents of 1900—basic patents for the manufacture of such slabs. Mr. Hatschek was an Austrian paper and cardboard maker, and his patent has reference to the manufacture of sheets from asbestos and Portland cement in machines similar to those used for making cardboard, to which their great strength is attributable. It may be mentioned that "Eternit" is on the Admiralty and War Office lists, and large roof areas have been executed with the material in both foreign and home stations, including those at Kingston (Jamaica), Gibraltar, as well as at Sheerness, Chatham, Devonport, Portsmouth, &c. "Eternit" is supplied by Messrs. G. R. Speaker & Co., of London.

MR. THOMAS HARDY ON CHURCH RESTORATION.

AT last Wednesday's annual meeting of the Society for the Protection of Ancient Buildings, held at Burlington House, Mr. Thomas Hardy, the novelist, read a paper on "Memories of Church Restoration." He said it might be true that our more intelligent architects now knew the better way, and that damage was largely limited to minor buildings and to obscure places. But continue it did, despite the efforts of that Society, nor did it seem ever likely to stop till all tampering with chronicles in stone were forbidden by law and all operations bearing on their repair permitted only under the eyes of properly qualified inspectors. The difficulty they encountered over the threshold in respect of church conservation was the fact that the building was held in two contradictory lights and was required for two incompatible purposes. To the incumbent the church was a workshop or laboratory, to the antiquary it was a relic. To the parish it was a utility, to the outsider it was a luxury. How could they unite these incompatibles? Continuing, Mr. Hardy, after dwelling upon the mistakes of builders and the abuses in the rehanging of bells, asked why the old sets of chimes had been removed from nearly all the country churches. Another abuse of ecclesiastical

fabrics was that arising from the fixing of Christmas decorations. The battalion of young ladies to whom the decking with holly and ivy was usually entrusted seemed to be possessed with the fixed idea that nails might be driven not only into old oak and into the joints of the masonry but into the freestone itself, if you only hit hard enough. The bulk of preservation lay in organizing resistance to the enthusiasm for newness in those parishes where priests and churchwardens regarded a church as a sort of villa to be made convenient and fashionable for the occupiers of the moment.

A Reservoir is proposed to be constructed by the Birkenhead Town Council, as first part of a new water scheme, at an outlay, including the cost of pipes, of about three-quarters of a million of money.

A new Book on Haddon Hall, by Mr. G. Le Blanc Smith, is announced to be published by Mr. Elliot Stock immediately. It will deal with the great families who have owned Haddon since the Conquest, and will furnish much new and hitherto unpublished information concerning the estate and its owners. A full description of the ancient fabric, its store of tapestry, old glass, carvings and metal-work will be included, and the whole work will be fully illustrated by photographs and facsimiles.

THE BUILDERS' JOURNAL

AND ARCHITECTURAL ENGINEER.

June 27th, 1906.

CONTRACTORS' SUPPLEMENT (MONTHLY).

THE QUANTITY SURVEYOR

In his relation to
The Builder and the Estimating Clerk.

By W. E. Davis.

IN the consideration of the relationship of the three individuals above mentioned we can reduce the parties to two—the quantity surveyor representing one and the estimating clerk the other. The builder for the present purpose can be left out of the reckoning, as in this relationship he is fully represented by his estimating clerk. "Estimator" would, we think, be a better title and a more just one to the individual, the term "clerk" suggesting a somewhat subordinate position rather than the very important one which the estimating clerk holds in a large contracting firm, or indeed in a business of any size where the estimating is not done by the principal.

The Importance of the Position

is hardly sufficiently appreciated until one considers that practically the fortunes of the business are in his hands. In the first place he has at the outset to steer carefully between two positions. He must be (except under those special conditions which may be left out of consideration here) at the bottom of the list of tenders in order to secure the work, at the same time not "too much so," as his employer, with that want of consideration that employers are sometimes guilty of, would not fail to remind him and call attention in very forcible terms if he found that he could still have been at the bottom of the list and yet have had anything from 5 to 15 per cent. more on his price; on the other hand to be very close and yet not quite at the bottom, that is, to lose the work by 1 per cent. or under is very little if any more appreciated. It is therefore obvious that the estimating clerk's responsibility in these days of keen competition is a very serious one, and that practically the fortunes of his employer are largely in his hands from the time of pricing the estimate until the settlement of the final accounts.

Record of Variations.

It is becoming a very usual and at the same time a desirable practice with large firms for the "estimator" (to use the more dignified title) to have the control during the progress of the various works for which he has estimated, so far as the ordering of the various materials is concerned and the keeping of a record of the variations from the contract. This can only be done by systematic visiting, when in consultation with the foreman in charge he arranges to have the materials on the works in something like the order in which they will be used, in order to avoid delay and the expense of storage and shifting. In town work in a confined situation these are somewhat important matters. By keeping in touch with the work he is enabled to keep a close record of variations and gives notice to the quantity

surveyor when work is about to be covered up, such as underpinning, extra work to foundations and those many things the measurement of which at the time of execution saves so much discussion and dissatisfaction at the end of the work when the time comes for the final settling of accounts. Finally comes the meeting with quantity surveyor, when he practically has to act in the capacity of a quantity surveyor in watching his employer's interests, by bringing forward his claims and seeing that they are properly measured—at least so many of them as are allowed. This last is important, as it is in this connection that the estimator has to be

Something of a Diplomat.

for while he should be careful of his employer's interest he should avoid bringing up vexatious claims, to find, as is sometimes the case, that he irritates the quantity surveyor and in addition to that not only discovers a mare's nest, but also that the surveyor has "something up his sleeve," so that the claim finally results in an omission rather than the expected addition.

The Place of the Clerk of Works.

Where a competent and conscientious clerk of works is employed the settlement of variations is considerably simplified, as it is possible for a record to be kept of these during the progress of the works, and the exchange of signed copies of these notes leaves the surveyor to deal only with the measuring. Where no clerk of works is engaged and the work is to be covered up and there is no drawing showing the variation, the careful estimator will give notice to the surveyor, so that he can at any rate take a note of the work so covered up, even if he does not take the full measurements.

Although most contracts provide that

Day-sheets

shall be sent in weekly where daywork is to be performed, this stipulation is too often ignored, with the result that endless discussions take place as to their correctness, whereas if this were enforced such discussion could take place while the work was in the minds of those concerned, when errors would be easily discoverable and as easily rectified. This question again is simplified by the presence of the clerk of works. A clerk of works' signature on the day-sheets should not necessarily cover more than the fact that the time and materials therein given are correct, leaving the question as to whether the work should be measured to the discretion of the surveyor, with a due regard to fairness. Contractors may sometimes complain that a surveyor is somewhat "close," but generally there are few complaints of unfairness.

A point not to be lost sight of in dealing with the delay in the delivery of day-sheets is

The Temptation to "Load"

them when it is known that their consideration is likely to be postponed till a date when it will be impossible to recall every-

thing connected with them. Artemus Ward was of opinion that there was "a lot of human nature in man." A foreman, after all, is a very human man (we will leave out of consideration his employer and the estimator) with a natural desire to bring his work out well for his employer, even if he has not, owing to the price the work has been taken at, a difficulty of "getting home" with it. He is greatly tempted to "help the job" by getting "something in" on the day-sheets, and being greatly tempted, has been known to fall. By strictly enforcing the weekly delivery of day-sheets, much trouble and a good deal of suspicion will be saved and the satisfaction will be felt that by so doing the foreman will be spared the pain of wounding his conscience, thus conducing to his peace of mind when he reflects upon his days' works. There may possibly be exceptions to the last sentence, but we are dealing here with things as they ought to be, and we hope in the majority of cases do exist.

No surveyor will complain if the estimator brings forward a long list of

Variations.

provided they are clearly defined and he (the estimator) is prepared to deal with them in a reasonable manner. This is, of course, always supposing that the quantities have been properly taken out, and that this long list is not due to vague descriptions and errors of omission. One estimator the writer has met on various occasions (and who will be again mentioned later in dealing with pricing) brings forward such a list and against each item he has a note referring to the quantities and also a note in a note-book he keeps for the purpose. As an example, he makes an abstract of the ironmongery (with the positions according to the specification) and similar fittings, also of the "prime cost" amounts included in the quantities, and against these a note of those executed and the prices against the "prime costs," while the receipted invoices showing the proper discounts are also forthcoming at the settlement as a matter of course, and not, as in too many instances, as the result of one or more applications. Consequently the disputed or debatable items are surprisingly few, even in the most complicated works. This doubtless entails a good deal of work upon the estimator, but the result is eminently satisfactory to the surveyor, as saving him a great deal of the worrying investigation that these items generally entail (as the writer is writing as a quantity surveyor the reader will pardon this note of appreciation), and, as far as the writer can ascertain, is satisfactory also from the point of view of the contractor. The continuance of the system is some guarantee as to this last, and, as it is methodically carried through the extra work at the earlier stage, is probably a good investment of time. This system consistently carried out certainly tends to the expeditious settlement of the work upon the job as well as helping to a thorough investigation of

any claims put forth. The estimator, too, feels that he is getting all that he is justly entitled to, and at the same time has a fair idea as to how the account will work out as compared with the cost.

Then comes the all-important point of

Pricing.

For, however voluminous may be the bills of quantities, there are always a number of items to which these do not apply. Here again is an opportunity for the exercise of that valuable commodity, tact, for while the estimator should get all to which he is legitimately entitled, greed sometimes produces disastrous results. In the writer's professional experience, he has had dealings with estimators of almost every character, *i.e.*, business character. And one of the most satisfactory to deal with is the one before mentioned. He adopts a practice which at first sight appears pedantic.

Marginal Analysis of Prices.

In pricing all-important items he analyses his prices on the margin of the bill, this analysis being the result of close observation and long experience on various works. The effect being, that in many cases the contract prices can be made to apply in part to the items in the variations. Moreover, the prices throughout this estimator's bills are consistent from beginning to end. As mentioned above, this system appears at first sight pedantic, but in practice it is not so, while the settlement of accounts has been simplified, and although the work has been obtained in keen competition, the result has been satisfactory to all concerned. This no doubt has also—from the builder's point of view—been to a great extent due to the fact that this estimator keeps his work closely in touch all through, the consequence being that the waste in ordinary materials is infinitesimal.

The Quantity Surveyor's Part.

We have dealt somewhat fully with the position and duties of the estimator, by which it is clear that his work demands great experience and that he has to exercise the greatest discretion. In writing the foregoing we have premised that the quantity surveyor has performed his part of the work properly, *i.e.*, his bill of quantities has been free from those vague "sporting" items in which the differences in reading may make hundreds per cent. difference in the prices. In his relation to the estimator he has to remember that the items in the bill are all the information that the estimator has before him, and that "thought reading" is not part of his qualifications. It is a very usual complaint on the part of architects that too much detail is given, and that this

Detail increases the Cost

of the work. Now the writer, with every wish to avoid quarrelling with his friends for obvious reasons, maintains that this is not the case, and that the proficient estimator with the full details before him prices every item on its merits, whereas without this detail a "covering" price is put down which in 90 per cent. of the cases works out to considerably more than the sum total of the detailed items. The contrary may have been the case years ago, but estimators of the modern school approach their work in a more methodical manner than did their predecessors.

Prices are more closely cut

than ever they were before; therefore with the fuller information and the absence of speculation the estimator is enabled to leave a smaller margin.

Apropos of this a large provincial contractor told the writer that he generally priced the average London quantities 10 per cent. less than those sent locally because he knew exactly where he stood; whereas in those items that left so much to the imagination he never knew what allowance

to make for the "extra labours," and so had to keep well on the right side to cover all contingencies.

A system that it is well for the surveyor to bear in mind is the

Greater Subdivision

of the various bills than is usually the case. In theory this lengthens the bills unduly, but in practice it is found not to be the case. It enables everyone concerned to trace the various items more easily, and thus gives the contractor a better opportunity of judging of the correctness of the bills of quantities. This possibly may not appeal to all surveyors, but no practitioner worthy of the name would raise any objection to such a check, while it would certainly have a tendency to separate the sheep from the goats in the surveying profession.

It is somewhat satirically said that speech is

Intended to Conceal Thoughts,

and some bills of quantities give one the impression that they were intended to conceal the thoughts of the architect; they remind one somewhat of those "jobbing builders'" accounts which are evidently prepared with the idea of rendering checking impossible. While leaving the exact method of subdivision open, it is sufficient to say that any system which tends to give the contractor greater confidence, will have a beneficial effect in tendering, by enabling him to price each item more closely, as the element of speculation will be reduced to a minimum.

While dealing with the bills of quantities attention may be called to the question of

Marginal Sketches.

As is well known, in other subjects, a sketch will very often save pages of writing, and at the same time more clearly explain the point under consideration. So it is with a bill of quantities, a good marginal sketch will make an item clearer than a column of description. Good is emphasized, as it is too frequently the case that the term "sketch" is taken much too literally. A puzzle diagram is sometimes given absolutely with no character and entirely out of proportion. Possibly the surveyor "taking-off" may not be a very excellent draughtsman, and the "workers-up" no better and possibly worse. So that in the various stages of transition, the final sketch bears little resemblance to the architect's drawing.

One surveyor the writer is acquainted with follows a very good system, *i.e.*, by not putting the sketches in the dimensions at all, but by indicating them with a letter in pencil on the drawing and referring in his dimensions to that letter and giving the number of the drawing. These are then traced from the drawing for insertion in the bills. Of course by this system it is essential that the "taker off" should be referred to to point out how much he wishes included; he also has to use care in reading over the bill to see that they comply with his intentions, but the result is certainly satisfactory. In any case they should be drawn to scale and well dimensioned.

The Conclusion

may be arrived at that the relation between the quantity surveyor, the builder and the estimating clerk is one of mutual dependence, and while the interests are not identical a much more satisfactory result for both client and builder is obtained by each one acting to the best of his ability in his department. Antagonism is disastrous to all concerned, and certainly in very few cases has either party suffered by a friendly business association. But "friendly business association" must not be read as looseness on either side. Neither party must forget the interests he has to serve, but there is absolutely no reason why—with each doing his work in a conscientious manner—"friendly business" should not be synonymous with "strict business."

Builders' Notes.

Another Master-Builders' Association—Blackburn has about 120 master-builders within itself and within the local area which is properly regarded as belonging to the town. It has therefore been decided to form a master-builders' exchange as a common centre for members of the craft.

Master Builders to Visit Dublin.—The National Federation of Building Trade Employers of Great Britain and Ireland will hold their annual conference in Dublin, commencing on Tuesday, July 31st, with a council meeting in the Mansion House, where the general meeting will open the following day at 10 a.m. Entertainments and excursions will take place subsequently. Mr. John Good, hon. secretary of Dublin Master-Builders' Association, is sparing no efforts to make the proceedings a success.

Prosperous Builders.—The depression in the building trade does not appear to have affected the earnings of Spencer, Santo & Co., Ltd., as the directors are able to pay 10 per cent. for last year, the same rate as in the two previous years. The nett available balance on December 31st last, including the amount brought forward from the previous year, was £24,156, out of which it is proposed to pay 6 per cent. on the ordinary shares, making with the interim dividend paid 10 per cent., and leaving a balance of £4,396 to carry forward.

A Lathe Works.—Messrs. John Lang & Sons, lathe manufacturers, Johnstone, have concluded contracts for the erection of additional works which will more than double their present extensive buildings. The firm lately added thirteen acres of land to their grounds, and important extensions were made, including a new iron foundry, pattern shop, pattern stores and suite of offices. The contracts have been secured by Messrs. George Robertson & Co., Paisley, for brickwork, and Messrs. Robert Simpson & Co., Ltd., Johnstone, for carpenter, joiner and glazier work, and also for the erection of all steelwork in connection with the new buildings. When finished the works will be the largest in Britain devoted to lathe manufacture. The department alone devoted to the manufacture of lathes measures over 700ft. in length by upwards of 500ft. in width.

Carpenters and Joiners.—The reports of the branches of the Amalgamated Society of Carpenters and Joiners for the quarter ending March show the expenditure of the society to have exceeded receipts by £9,236, thus reducing the cash balance to £85,042, this being £3,479 less than in the corresponding period of 1905 and £38,944 short of the stipulated amount required by rule. The members of the ordinary section are therefore called on to pay an increased levy of 3d. a week, making 9d., and trade section members an increase of 1d. a week, making 3d., in order to place the society in a proper financial position. Three thousand are on the out-of-work fund. The beneficent work of the society is evidenced by the fact that the average number of members who draw sick-pay exceeds 1,500, and that there are nearly 2,000 members in receipt of an old-age pension.

Architects and Contracts.—The hon. secretary of the Master-Builders' Association of Dublin, writes: "At a largely attended meeting of the members of this Association the following resolution were adopted unanimously: 'That although conditions of building contract have been under consideration for many years, we now regret to learn from the public press that the members of the Royal Institute of Architects of Ireland have at a recent meeting adopted without discussion a set of conditions without any

consultation with the Builders' Association as to their views on a matter so vitally important to their interests, contrary to the custom and practice adopted in England and Scotland, where this matter was the subject of many conferences between the architects and builders prior to its mutual adoption. While willing and anxious at all times to carefully consider any proposals whereby equitable terms on contract might be agreed on, we respectfully decline to be forced to accept or sign conditions which are, in our opinion, inequitable and unfair, and which differ materially from any accepted conditions at present in use in the United Kingdom. The members of the Association will continue to accept and sign the conditions of contract at present in use in our city, and also those agreed on between the Royal Institute of British Architects and the Association of Master-Builders of Great Britain and Ireland."

THE LABOUR MARKET.

Board of Trade Returns for May.

THE Board of Trade returns show that employment in the building trades was quiet generally, except with painters, who were well employed. It was better than a month ago and a year ago.

As regards London, returns received from forty-one London employers show that in the last week of May they paid wages to 9,682 workpeople of all classes, compared with 9,951 in April and 11,979 in May, 1905. Employment generally remained very quiet, except with painters,

who continued busy. Returns from trade unions in London show little change on the whole in the state of employment as compared with a month ago and a year ago. The percentage of unemployed trade-union carpenters in London at the end of May was 8.2, compared with 6.5 in April and 8.3 in May, 1905. With plumbers the percentages unemployed for the three periods were 13.7 for May, 1906; 13.5 for April, 1906, and 14.2 for May, 1905. In the case of both carpenters and plumbers, the percentage unemployed in May, 1906, was higher in London than in any other district of the kingdom. Bricklayers and plasterers reported a slight improvement in employment; masons and painters reported a decline.

As regards the Provinces,

seventy-four returns were received from employers' associations in towns outside of London. On the whole employment in these towns was quiet.

The following information is based on returns from trade-unions and local correspondents:—

Bricklayers.

With bricklayers employment remained dull generally, but was better on the whole than a month ago, especially in Lancashire and Cheshire, Yorkshire and the Midland Counties. Compared with a year ago, little general change was shown.

Stonemasons.

Employment with stonemasons was dull generally, but slightly better than in April. It was much the same generally as a year ago, but worse at Aberdeen. At Plymouth, Nottingham and Dundee it was worse than a month ago.

Carpenters and Joiners.

With carpenters and joiners employment showed no general change compared with a month ago, but was better than in May, 1905. The percentage of trade union members unemployed at the end of May was 5.4, the same percentage as in April. In May, 1905, the percentage was 6.8. The improvement, compared with a year ago, was shared by most districts; some decline however, was shown in the southern and south-western counties and Wales.

Slaters and Tilers.

Employment with slaters and tilers showed an improvement compared with last month.

Plumbers.

With plumbers employment, though quiet, was better than a month ago, and considerably better than a year ago. The percentage of trade-union members unemployed at the end of May was 7.9, compared with 9.0 in April and 10.9 in May, 1905. The improvement was general.

Plasterers.

Employment with plasterers was dull. It showed a slight improvement on the whole as compared with April, but in Scotland it was worse. Three hundred plasterers are reported to have left Glasgow this season for the United States and Canada.

Painters.

Painters continued well employed, and reported an improvement compared with April and also compared with May, 1905. Overtime was worked in many cases.

Labourers.

With labourers employment remained quiet, and showed little change as compared with April.

ARCH OF PICCADILLY HOTEL ON THE FRONT TO REGENT STREET QUADRANT.

The above photograph shows one of the arches over the shop fronts of the Piccadilly Hotel, now in course of erection. Several views of the general excavation have been given in former issues of this supplement. Mr. William Woodward and Mr. Walter Enden are the architects of the building, but for the frontages Mr. Norman Shaw is responsible. It will be seen that the steelwork carries the weight of the floors, while the stonework is built outside it, and will apparently sustain the front walls. It is therefore not exactly American frame construction, but conforms to ordinary English practice.

The Month's Trade.

(Reports by our Special Correspondents.)

THE STONE, GRANITE AND MARBLE TRADES.

These trades show practically no change for the better; what little improvement there is is due more to the season than to any improvement in trade generally. The holidays interfered with trade at the beginning of the month, but towards the end of May it improved somewhat.

The Board of Trade reports for May are as follows:—

Employment in limestone quarries in South Durham was fairly good, the same as a month and a year ago. In Weardale it continued good. It was quiet in the Plymouth district, and was not so good as usual at Buxton, but in both districts it improved towards the end of the month.

As regards other stone employment was fairly good at Sheffield, and there was full employment at Rotherham and Normanton. At Gateshead employment was fair. It continued moderate in the Cleve Hill road material quarries. In the Rowsley and district grindstone and building stone quarries employment continued moderate, but was a little better than a year ago. In Forfarshire it continued bad, short time being worked in many quarries.

Employment in the granite quarries in Aberdeenshire was fair, about the same as a month ago, but rather worse than a year ago. Employment was also fair in Leicestershire, where an improvement on a month ago was shown. In Devonshire and Cornwall it continued bad, with much short time.

Employment with settmakers was good at Edinburgh and in Aberdeenshire, and fair at Airdrie. At Stoney Stanton it was good and better than a month ago, and it was fair generally in North Wales. It continued moderate in the Cleve Hill district.

The returns for imports of stones, slabs and marble, rough, hewn and manufactured, for the month of May, 1906, as compared with the same month in 1904 and 1905, are as follows:—

Tons.			Value.		
1904.	1905.	1906.	1904.	1905.	1906.
130,736	108,409	129,494	£142,443	108,837	134,615

Part I. of the General Report on Mines and Quarries for 1905 contains statistics of the number of persons employed, the output of minerals, and of accidents at mines and quarries in the United Kingdom arranged according to the inspection districts. The total output (in tons) of the under-mentioned minerals in the United Kingdom in 1905 as compared with 1904 was as follows:—

	1904.	1905.
Clays and shale	15,948,915	15,134,754
Limestone (other than chalk)	12,041,135	12,501,780
Igneous rocks	5,988,821	5,936,900
Sandstone	5,305,363	5,639,566
Chalk	4,438,728	4,535,584

THE CLAYWORKING INDUSTRY.

Notwithstanding the prevailing depression, the brick and tile trades managed to improve slightly last month. Employment was moderate, and better than a month ago. We can only hope that the improvement will continue. These trades need it badly enough. The Board of Trade labour returns for May state that employment on the whole was moderate, but was good in the Oldham district, and in Norfolk and Cambridgeshire; and fair in the Tees, Bradford and Plymouth districts. In South Staffordshire it was bad.

The British Vice-Consul at Tangier states that the increased activity in the building trade at the port has created a considerable demand for bricks and tiles.

THE SLATE AND TILE TRADES.

Slate Trade.

The slate trade has shown a slight improvement lately. Enquiries are more numerous, but the superficial areas given for schedules are generally small, consequently a reduction in stocks will hardly be appreciable. There is a much brisker demand for special classes such as Westmorland, Precelly, Colleyweston, Welsh Green and Delabole. In certain parts of the country (especially in large agricultural districts) there is a considerable revival in building, and the demand for material for estate purposes shows a decided improvement on that of last year.

In London trade is generally very quiet, one reason for this being that the area of slating now used on buildings such as warehouses and factories has been curtailed owing to the substitution of glazed lights or patent glazing; consequently most of such roofs facing north are now glazed. This is also very largely the case in the public buildings now under construction, and undoubtedly accounts for a large falling-off in the quantity of material usually taken by London merchants from the Welsh quarries. Speculative building has also been in a stagnant condition, and has not yet recovered. Cheap money has a great influence in this branch of the building trade, and there is now apparently a prospect of things being better.

In Wales trade continues to be in a somewhat depressed condition, a few quarries are busy, but generally there is little difficulty in obtaining any reasonable quantity at short notice. So far as can be ascertained the present prices will rule to the end of the year.

The Westmorland district reports a very substantial improvement all round, and the prospects of the green slate trade have improved by over 30 per cent. during the present year. These remarks will also apply to the quarries in the Coniston district.

The demand for Precelly slates continues to be general from all parts of the kingdom, and from the number of contracts coming out where these slates are specified the quarry will undoubtedly be kept busy to the end of the year.

The Colleyweston slate trade continues good; in fact, the demand is greater than the supply. Amongst the largest jobs recently completed are Crathorne Hall, Yorkshire, and Burrough Court, Leicestershire. Among the principal buildings now in hand are New Grammar School, Lincoln; Merton College, Corpus College and New Library, Lincoln College, at Oxford, and Christ's College, Trinity College and Pembroke College, Cambridge.

We understand there has recently been a large demand for the Vronheulog Welsh green slates, and their colour and durability have much to recommend them.

From the Delabole district we understand that trade, though not brisk, is showing an improvement, this slate being now freely specified. Special attention might be directed to the "specially stout best slate," averaging about $\frac{1}{4}$ in. in thickness. This quarry have recently shipped a considerable quantity of slates to Belgium.

The Board of Trade reports that employment in the quarries in North Wales continued slack, and was worse than a year ago. Full time was worked in the Festiniog district, but there was a large number of men unemployed. Employment was quiet in Argyllshire, but a slight improvement was shown as compared with a month ago.

Tiling.

There is a very considerable improvement in the prospects of the tile trade, enquiries being rather more numerous than for slated roofs; this is mainly accounted for by the fact that tiles are apparently the favourite covering for scholastic buildings. Reports from the makers state that among the most satisfactory orders received of late are those for school buildings, though they complain of a lack of improvement in the trade generally.

There has been an increasing demand of late for old roofing tiles. This is fully appreciated by the fortunate possessors of these articles, who generally demand a very high figure, and in most cases prefer not to sell at all, as the tiles are most valuable to country builders for repairs. Consequently the cost of tiling with old tiles is very nearly double that of new.

"Old" Roof Tiles.

The desire to give a general effect of an old roof, which was formerly sufficiently limited to be met by the available supplies of genuine old tiles, has indeed now increased so much that tile makers have found it desirable to make an imitation old tile to meet this demand, the supply of genuine old tiles being entirely insufficient. We have seen a good example of these "new old" tiles, which appears to us to more nearly approximate the genuine article than any we have come across. It is somewhat dark in colour, and twisted sufficiently to give the old effect, without being so much so as to endanger the water-tightness of the roof when laid. We understand that the sole agents for the United Kingdom for these tiles, Messrs. Roberts, Adlard & Co., of Bermondsey, have arranged to keep a stock of them in London, and that the price is about the same as for ordinary Broseley tiling. Ridge tiles are also made in similar material to give a finished effect, these ridge tiles being also very suitable for use on green-slatted roofs.

Wall-tiling.

Of late there have been one or two enquiries for wall tiles which will be welcome to the trade generally, in so far as our experience tells us. The orders in this particular industry have been very scarce; and most of the works are prepared to supply considerable quantities on demand.

THE PORTLAND CEMENT TRADE.

The market for Portland cement continues to show great activity, and it seems probable that before long buyers may have some difficulty in procuring their supplies with that promptitude which was so characteristic of the position during the past years of depression. Already many manufacturers are denuded of stocks which had accumulated during the winter and spring months, and as there are no signs of any abatement in the demand, it can only be a matter of a very short time before the position thus created is reflected in the price which already is above the figures quoted a few weeks back. A point of interest to both buyer and seller is, that the position on the Continent is very much the same as it is in this country, and reports go to show that it is almost impossible to obtain a good reliable brand of artificial cement for early shipment. Prices of natural cement have followed in the wake of the better qualities. In the present condition of things it is additionally important for the consumer to take every precaution against being supplied with Belgian natural cement—the English wording "Portland cement" on the bag is unfortunately no safeguard, for this material is allowed to enter the country so marked without any qualifying words

denoting its foreign origin which would give some indication of its quality. A guarantee should always be insisted upon that the cement supplied is genuine artificial—preferably of British manufacture, otherwise with the inducement before him of snatching an unduly high profit the unscrupulous merchant will be at an advantage in his dealings with the consumer who does not buy on a specification. Certain manufacturers appear to be somewhat concerned at the report from Washington that the American Government will only buy the constructional materials required for the Panama Canal, including cement, from American manufacturers, and opinion is somewhat divided as to what effect this will have upon our own industry. It must affect to some extent those manufacturers who are engaged in the export cask trade, but as a set-off against this the enormous advance made in this country with the ferro-concrete method of construction must result in a very substantial increase in the demand for cement.

The statistical position for the month of May was again in favour of this country, as exports show a large increase, and there is a noticeable falling off in the imports.

The returns for imports and exports of cement for May, 1906, as compared with the same month in 1904 and 1905 are as follows:—

		IMPORTS.		
		1904.	1905.	1906.
Tons	-	25,625	24,372	19,040
Value	-	£37,358	32,312	24,380
		EXPORTS.		
		1904.	1905.	1906.
Tons	-	39,770	48,945	56,345
Value	-	£66,452	79,373	83,550

In his report on the trade, &c., of the States of Oregon, Washington and Idaho for the year 1905, H.M. Consul at Portland writes: "The demand for cement increased as the year progressed and stocks held at the beginning of the year were rapidly depleted. The supplies in sight are not nearly sufficient. This trade, however, does not appear to be cultivated by the British maker, as not one cask was received from the United Kingdom during the year. Prices have advanced, and the article is being used much more in buildings, streets, &c., and there is an extraordinary demand for railway purposes and irrigation works throughout the district. At this time there is practically none in the market, with prospects of a scarcity for some time to come. Prices have temporarily advanced to 13s. per cask. Market prices during

the year ranged from 8s. 4d. to 10s. Receipts from California were about 35,000 bags; the quality of this is reported irregular and the capacity of factories is not equal to the demand. Japanese cement will be received more largely in future. There seems to be some probability of cement works being started at Bellingham on Puget Sound, where very satisfactory working tests have been made of raw material found there."

Our Vice-Consul at Tangier reports that the activity in the building trade at that port has created a large and increasing demand for cement.

Russia claims to be the third most important Portland cement manufacturing country in the world, based on the shakiest foundation. That industry in Russia is being formed into a somewhat aggressive syndicate, and the official "Commercial and Industrial Gazette" says that while the production of cement in Russia up till the eighties was of the most modest dimensions, from that time the industry grew so that it soon became the third largest cement manufacturing country in the world. Reliable statistics are not available for a period later than the year 1900. In that year Germany produced 30,000,000 barrels of 10 poods each, England 9,000,000 barrels, and then came Russia with 4,000,000 barrels. Then follow France, with a similar but slightly inferior quantity, and Belgium and Austria-Hungary with about 1,000,000 each. But why not later than 1900, and where is America!

THE TIMBER TRADE.

The Board of Trade reports that during May employment with mill-sawyers and woodcutting machinists was about the same as a month ago, but better than a year ago. Trade unions with a membership of 4,607 reported 197 (or 4·3 per cent.) as unemployed at the end of May, compared with 4·2 per cent. at the end of April, 1906, and 5·9 per cent. at the end of May, 1905. Employment was good at Nottingham and Coventry; fair or moderate at Burnley, Oldham, Preston and Bristol; improving at Birmingham and Leeds; and bad at Liverpool, Hull, Wolverhampton and Leicester.

The Liverpool Market.

Timber for building purposes has been selling at Liverpool fairly freely. The spot trade has not been very active, but much timber of the lighter sorts has been passed

on inland after coming to hand, apparently to replenish dealers' stocks, as these have been drawn upon pretty freely of late for local requirements. The building of new places for manufacturing purposes, within easy reach of Liverpool, shows no sign of abating, for though some of the larger structures are now well advanced, new work of the kind, chiefly additions to existing mills and premises used for industrial purposes, is being carried out. It seems, indeed, as if the prosperity of the cotton trade and of branches of the woollen trade had prompted directors and principals to make contemplated extensions and additions to their mills and works at the present time. There is still accordingly a good demand for joists and floorings, while joiners are busy on woodwork for internal fittings.

Values of timber generally have been well maintained. At times there have been slight easings of prices, but there have been recoveries, and quotations at date are, as a rule, high.

Canadian Pine Deals

have come to hand to a moderate extent, and have been received chiefly by two large importing firms, Robert Cox & Co. and Watson & Todd. Sales of this timber have been fair, so that stocks have not yet increased, and are materially lighter than they were a year ago. Prices have lately shown a hardening tendency.

Canadian Spruce.

Quebec spruce has been received in small quantities, and the stock is slightly reduced, though still in excess of that held twelve months ago.

Spruce and pine deals from New Brunswick and Nova Scotia have arrived in larger quantities, but deliveries have been in excess of the importation. Stocks have been further reduced, the total at date being less than last month and than a year ago. Prices remain practically unchanged.

Norwegian Flooring Boards

have come to hand in ample supply, though not quite so freely as a few weeks ago. The demand has, however, slackened, and the total of stocks is appreciably greater than a month ago. Recent prices are well maintained.

Baltic Red Deals and Boards

have been received in small quantities. The stock is now less than a month ago, but apparently quite ample for the consumption.

In Square Pine

Quebec has been in good demand, though the deliveries have been less than last month. The stock is small compared with the recent rate of consumption. Prices are well maintained.

Red Pine

has been neglected and the stock remains substantially as last month.

Oregon Timber

in logs and planks has met with good enquiry, and fairly large deliveries have been made. The stock is still extensive and fully adequate for the consumption. Prices continue very firm.

Pitch-pine

has received considerable attention, and good business, on the whole, has been done in this branch of the trade. Hewn has arrived in fair quantity, and deliveries have been heavier. Sawn has come to hand in larger quantities, and the consumption has also been on an increased scale. Prices have been a little easier. Planks have been received much more freely. The stock is in excess of last month's, though less than half of what was held a year ago. Prices are well maintained.

Oak

from the United States has arrived in larger quantity and the consumption has been on a fair scale. The stock is comparatively light, though ample for the present scale of consumption. Logs are dearer. Planks have come to

THE GLASS TRADE.

The glass trade continues fair. The Board of Trade reports that employment with sheet-glass makers and flatteners during May was good at St. Helens, and fair with pressed-glass makers on the Tyne and Wear, with glass blowers in London, and with flint-glass makers and plate-glass bevellers at Birmingham.

The returns for imports and exports of glass for the month of May, 1906, as compared with the same month in 1904 and 1905, are as follows:—

		IMPORTS.					
		1904.	Cwts.	1905.	1904.	Value.	1905.
Window and German sheet, including shades and cylinders		117,791	83,035	126,200	£66,586	50,908	70,692
Plate		47,995	34,829	39,498	59,399	42,839	38,701
		EXPORTS.					
		1904.	Cwts.	1905.	1904.	Value.	1905.
Plate		9,631	11,568	14,504	13,544	15,009	19,242

THE PAINT TRADES.

The paint trades are fair. As regards materials, the returns for imports and exports for May, 1906, as compared with the same month in 1904 and 1905, are as follows:—

		IMPORTS.					
		1904.	Cwts.	1905.	1904.	Value.	1905.
White lead	-	26,888	25,334	25,068	£20,588	21,396	22,491
Zinc oxide	-	138,659	25,273	23,211	108,142	20,888	26,144
Other colours and pigments	-	19,986	131,276	131,855	36,657	84,840	81,081
Turpentine	-	9,191	21,841	12,830	36,657	40,980	20,622
Lac-dye, seedlac, shellac and sticklac	-		6,526	9,805	82,974	46,518	50,855
Linseed oil	-		Tons.				
		112	1,032	1,411	2,169	19,689	30,323
		EXPORTS.					
		1904.	Cwts.	1905.	1904.	Value.	1905.
White lead	-	25,909	35,000	38,277	26,115	33,824	40,559
Zinc oxide	-	127,639	4,009	7,153	147,777	5,764	7,953
Other colours and pigments	-		132,489	143,282		167,618	178,724
Linseed oil	-	3,553	Tons.				
			3,155	2,136	64,156	58,926	46,747

hand steadily and in fair quantity, and have found a ready market. Full prices continue to be obtained.

Birch

logs have arrived in moderately large quantities. The consumption has been on a fair scale, though not so great as the importation. Birch planks have also arrived in large supply. The prices of this wood have also eased.

Teak

has been less active. Planks have arrived in larger supply, but the consumption has been lighter. Values have been maintained.

Mahogany,

to judge by the stocks now in hand, and the readiness with which attractive wood found purchasers at the last sales, has still a good market.

THE IRONMONGERY TRADE.

The Board of Trade returns for May show that employment at Wolverhampton in the lock and latch trades continued bad, with short time. With makers of hollow-ware and of iron fences and hurdles it was good. Employment with hollow-ware makers continued slack at Sheffield, and was moderate at Birmingham and West Bromwich.

Employment in the stoves, grates, &c., trades continued good at Bolton and Bury, and was quiet in the Sheffield district and at Leeds. At Glasgow and Falkirk it was fair.

With nut and bolt makers employment was good at Winstan and fair in South Wales; at Darlaston it continued to improve, and was good. With nail and rivet makers it was fair at Birmingham and Smethwick. At Black Heath it continued fair with nail makers and quiet with rivet makers.

Employment in the wire trade was good generally, particularly in Halifax, Manchester, and Sheffield, where overtime was worked, and at Warrington and Norwich. In almost all the important centres it was better than a year ago.

In his report on the trade of Tangier, the British Vice-Consul at that port draws attention to the large and increasing demand for hardware, due to the great stimulus experienced in the building trade. "The import of British hardware fell 13 per cent. during the year, the British percentage being absorbed by Belgium and France, from which two countries steel and iron girders and ironmongery of all descriptions were imported in large quantities."

The return for imports and exports for May, 1906, as compared with the same month in 1904 and 1905, are as follows:—

	IMPORTS.			Exports.		
	1904.	1905.	1906.	1904.	1905.	1906.
Wire nails	-	-	-	-	-	-
Nails (other than wire nails), screws and rivets	2,766	2,890	4,131	£28,362	28,697	40,835
Bolts and nuts	1,125	1,036	865	18,570	17,320	13,903
	401	335	337	7,357	5,337	5,191
Nails, screws and rivets	1,820	2,227	2,465	35,384	42,299	44,931
Bolts and nuts	1,110	1,473	1,810	19,802	25,162	34,140

THE IRON AND STEEL TRADES.

Recent Progress.

We have never in these columns echoed the bootless theory that an earthquake on the Pacific Coast would shake our phlegmatic trade into a state of unprecedented vigour. But two months ago we ventured to suggest that there was a tendency to unseemly haste in writing dirges about a departing boom. We were inclined rather to believe that we were passing through a period of calm that would soon give way to a good trade wind of increasing vitality. That a time of solid prosperity is in store for us we are far from despairing of, but we want to see it germinate a little more rapidly.

However, if our home trade is not all that it might be, there are certainly some grains

of comfort to be gleaned from the figures of our export trade. In the recently issued statements of the Board of Trade some very encouraging advances in exports are shown both for the month of May and in the totals for the five months of 1906. The following are a few figures for the past month as compared with May, 1905:—

IRON AND STEEL EXPORTS, MAY.

	1905.	1906.
Pig iron	88,060	148,640
Wrought-iron bars	13,430	14,200
Galvanized sheets	35,418	34,630
Steel bars	14,900	18,700
Cast-iron goods	2,912	3,641
Wrought-iron goods	3,600	4,350
Steel girders	6,780	8,871

Pig iron has shown the most spirited advance, Germany, the Netherlands, Belgium and France having been the largest buyers. The total quantity exported to those countries during May is recorded at 78,800 tons.

The descriptions enumerated above are equally pleasing in their aggregates for the five months. The figures are as follows:—

IRON AND STEEL EXPORTS, JANUARY-MAY.

	1905.	1906.
Pig iron	354,700	548,681
Wrought-iron bars	54,830	59,200
Galvanized sheets	168,010	184,630
Steel bars	54,910	76,320
Cast-iron goods	16,640	17,490
Wrought-iron goods	17,160	20,160
Steel girders	26,215	40,260

The holidays interfered somewhat with the progress of trade at the beginning of the month, and all over matters opened out rather quietly. Prices, however, remained pretty firm in spite of general slackness and the prevailing sparseness of fresh business.

In the Cleveland district, whilst pig iron commenced the month with considerable vigour, there were but few new orders for general iron and steel manufactures. Shipbuilding was distinctly dull, and it was feared that this would soon have a depressing effect on the manufactured iron and steel trades. Makers, however, had sufficient current orders in hand to keep them well employed for the time being, and signs have not been lacking that new business would come along before the disposal of their contracts.

In the Midlands the prevailing dulness of the preceding few weeks was more than ever emphasized at the commencement of the present month. Here, also, prices maintained a surprising degree of firmness. "Marked" bars were selling at £9 per ton, and "common" bars at £6 15s. to £6 17s. 6d. Galvanized sheets were in the happy position of having justified their enhanced figures, and prices ranged from £12 10s. to £12 17s. 6d. Angles averaged from £7 to £7 5s., and

channels and joists averaged from £6 15s. to £6 17s. 6d.

In Scotland the position was very much the same, although perhaps the volume of orders against current contracts was larger than in the centres on this side of the border. New business was sparse. The Scotsman, however, takes his holidays very seriously, and conscientiously disallows any considerations as to the state of trade to interfere with them. Consequently the output of manufactured material made but an indifferent tonnage.

Those interminable negotiations respecting an adjustment of prices for angles, as in the North-east of England and in Scotland respectively, were reported to be still "in progress."

The Present Position.

As the month advanced, affairs in the Cleveland district appeared to brighten up with the weather.

Pig iron, though solid enough in the fact, is a doubtful thing in the abstract to build up hopes upon, but the increased production and the high export figures which we have already presented have been so consistent and irrefutable that they may well be regarded as signs of the times.

Except in rails, however, new orders for manufactured steel have not come forward with anything like alacrity. Still, makers appear to have plenty of business on their books to be going on with, and there is a continued firmness about prices.

The following is a general comparison of present prices in various districts with those of 1905:—

IRON AND STEEL PRICES (per ton).

	1905.	1906.
Staffordshire marked bars	£9 0 0	£8 0 0
" common bars	6 17 6	6 0 0
Steel rails, Middlesbrough	6 7 6	5 7 6
" Lancashire	6 7 6	5 5 0
Steel angles, Middlesbrough	6 15 6	5 15 0
" Scotland	7 0 0	5 7 6
Steel plates, Middlesbrough	7 0 0	5 17 6
" Scotland	7 7 6	5 17 6

The position in Scotland has not changed materially, although many rumours are afloat respecting large shipbuilding orders which may come at any moment. When these assume a more definite shape, an all-round improvement may be looked for. Meanwhile specifications continue to come forward against running contracts, and prices are comparatively firm.

At a recent meeting of the Scotch steel-makers to consider the position of the trade it was decided to make no alteration in the existing quotations. It is not expected that anything will now be done until after the July holidays, and much may happen in the meanwhile to modify the ideas which at present obtain. The South American States, for instance, may prove to be friends in need if they close with the offers which have been made from the Clyde for the construction of six or seven large cruisers. Such orders as these would give great stimulus to the steel trade, and will effect a considerable change in the present state of the market.

In Sheffield trade has assumed a very vigorous tone. In practically all lines of manufactured steel, large and small, good business is being done, and orders for forward delivery are reported to be plentiful.

In the Midlands makers have pulled round considerably since the beginning of the month. Prices are steady and a very satisfactory quantity of new business is reported in various lines.

The following represent in round figures the prices prevailing in various classes of iron and steel manufactures in the Midlands:—

MIDLAND PRICES (per ton)

	£	s.	d.
Marked bars	-	-	0 0
Do. special	-	-	0 12 6
Common bars	-	-	0 12 6
North Staff. bars	-	-	7 5 0
Gas strip	-	-	6 15 0
Hoops	-	-	7 15 0
Black sheets	-	-	7 12 6
Girder plates	-	-	7 12 6
Joists	-	-	7 0 0
Angles	-	-	6 15 0
Mild steel bars	-	-	7 12 6
Galvanized sheets	-	-	12 15 0

In structural steel the improvement was most marked, and corrugated sheets showed an almost equal degree of vitality.

The state of affairs on the Continent is still one of abounding activity. All the Belgian and German works appear to be well supplied with orders for some time to come, chiefly for the home trade, and consequently they look with some indifference upon the markets on this side. Prices have not only been well maintained during the past few weeks, but appreciable advances have been recorded, at any rate for export

orders. Prices for delivery on this side in ordinary materials are all in the region of £1 per ton in advance of those quoted this time last year, and present conditions do not point to any falling off for the next few months. Rolled steel joists are quoted in London at the imposing figure of £6 3s. 6d. per ton or thereabouts for delivery in the Thames or equal East coast ports. Channels are about 5s. higher. Angles range from £6 10s. to £6 12s. 6d. and Tees £6 12s. 6d. to £6 15s. Steel bars are selling at £6 10s., and the same figures applies to heavy steel rails; half-round bars are quoted at £7, and fencing standards about 5s. below this figure, all c.i.f. Thames or equal. None of these figures point to heavy buying in this country, and the trade in Continental material generally will be tolerably flat until the prevailing activity on the other side shows signs of subsiding.

Other Metals.

The tin market still pursues its wild and erratic career. This remark was not original ten years ago, and we have no doubt it will still be a popular platitude ten years hence. Last month's record figure of £215 has, however, not been attained, or even approached since, and the strongest movements have really been in the reverse direction. Quotations have fluctuated during the past few weeks between £170 and £190, the figures in the region of £180 having been the most representative. During the latter part of May and early in June heavy shipments were made from the Straits, followed by an increase in the stocks on this side. It is hoped that this and other considerations will create a narrower limit to the fluctuations in prices, but this hope has been so frequently expressed and so frequently disappointed that we can only speak of the future with all reserve. Current prices are quoted in the region of £180, and recent movements have been comparatively mild.

Lead has displayed considerable steadiness recently, and prices continue good. Soft foreign ranges from £16 15s. to £17s., these figures being very similar to those quoted a month ago. Fresh arrivals have only totalled a small tonnage, and these quotations are not likely to be disturbed to any great extent. English lead is quoted at £17 2s. 6d.; pipes at £19 17s. 6d., and sheets at £19 10s. The imports of lead during May were 18,700 tons, this figure being about 1,000 tons below that for April.

Copper has not displayed any great degree of briskness latterly, and although prices have been constantly varying, they have not covered a very wide field. Quotations have ranged between £83 10s. and £86, and buying has not been heavy. Standard copper is now quoted at about £84, electrolytic at £87, and strong sheets at £99.

Good trade has been done in spelter, partly as a result of the activity in the galvanizing trade. Good ordinary is quoted at £27 15s. and special brands at about 5s. higher.

In galvanized sheets the briskness which characterized the commencement of the month has been well maintained. Prices have kept up a steady and consistent advance, and there appears to be no doubt that the present figures of £12 10s. to £12 15s. are pretty secure from any danger of slackening. Comparing prices with those of even so recently as six weeks ago, makers have certainly no cause for complaint as regards their present position.

THE WALLPAPER TRADE.

The wallpaper trade continues stagnant. It is only very slightly better than last year. Our exports last month were better than a month ago, and better than a year and two years ago, as the following return of paper-hangings for May will show:—

		IMPORTS.		
		1904.	1905.	1906.
Cwts.	-	-	4,733	6,637
Value	-	-	£13,003	17,389
		EXPORTS.		
		1904.	1905.	1906.
Cwts.	-	7,062	7,109	7,839
Value	-	£17,152	16,607	18,456

NEW LONDON BUILDINGS.

AT yesterday's meeting of the London County Council the Building Act Committee reported the following applications under the London Building Act, 1894, their recommendations as to consent or refusal being appended in *italics*:—

Retention of a building on the south side of Dalgarno Gardens and western side of Bracewell Road, Hammersmith, on the application of Bull & Bull, on behalf of P. Tinckham. (*Consent.*)

Iron and glass shelter in front of the Hyde Park Hotel, Knightsbridge, on the application of the Crittall Manufacturing Co., Ltd., on behalf of the Hyde Park Hotel, Ltd. (*Consent.*)

Retention of a motor-carshed on the forecourt of No. 117, Finchley Road, Hampstead, on the application of J. D. Hunter. (*Consent.*)

Oriel windows and balconies to a building proposed to be erected at Nos. 208 and 210, Great Portland Street, St. Marylebone, to abut also upon Bolsover Street, on the application of Lanchester & Rickards. (*Consent.*)

One-storey porch at St. Paul's Church, Kingsdown Road, Holloway, on the application of the Rev. C. E. Welson. (*Consent.*)

Oriel window and balconies in front of a proposed extension of the Berkeley Hotel, Berkeley Street, Piccadilly, on the further application of R. Griggs, on behalf of the Berkeley Hotel Co., Ltd. (*Consent.*)

Projecting balconies at No. 28, Grosvenor Street, St. George, Hanover Square, to abut upon Grosvenor Street and Davies Street, and a projecting chimney shaft to abut upon Davies Street, on the application of C. W. Stephens, on behalf of Lord Edward Spencer Churchill. (*Consent.*)

Oriel window at the first-floor level of the Portland Club, St. James's Square, to abut upon York Street, on the application of Hesketh & Stokes. (*Consent.*)

Forecourt fence in front of a house on the eastern side of Garrad's Road, Tooting Bec Common, northward of Prentis Road, at less than the prescribed distance from the centre of Garrad's Road, on the application of H. Shepherd, on behalf of G. R. Higgins. (*Consent.*)

Iron and glass shelter in front of the hotel "Maison Jules," Jermyn Street, Strand, on the application of G. D. Martin. (*Consent.*)

Addition at the rear of No. 4, Chelsea Embankment, on the application of H. T. A. Chidgey, on behalf of Sir W. Evans-Gordon, M.P. (*Consent.*)

Building to be used as a stable and coach-house at the rear of No. 42, Rushey Green, Lewisham, to abut upon Bradgate Road, on the application of H. Roberts, on behalf of C. Child. (*Refusal.*)

Extension of the period within which the erection of a workshop building on the northern side of Richmond Terrace, Clapham Road Kennington, westward of No. 90, Clapham Road, was required to be commenced, on the application of Sandom, Kersey and Knight. (*Consent.*)

Erection of a working-class dwelling on the site of No. 73, Bishop's Road and No. 1, Lark Row, Bethnal Green, on the application of Merrett & Mould on behalf of M. H. Pope. (*Refusal.*)

Erection of an addition at the rear of Nos. 417 and 419, Battersea Park Road, Battersea, to abut upon Carlton Grove, on the application of H. E. Rossiter, on behalf of F. Mühlenkamp. (*Refusal.*)

Modification of the provisions of that section with regard to open spaces about buildings, so far as relates to the proposed erection of buildings on the site of No. 11, Philpot Street, Stepney, to abut upon Nelson Street, with an irregular open space at the rear, on the application of E. H. Abbott, on behalf of C. Martin. (*Consent.*)

Deviation from the plans approved on July 4th, 1905, for the erection of a one-storey projection on part of the forecourt of No. 124, Victoria Street, Westminster so far as relates to the construction of a skylight in the roof of such projection, on the application of Griffin & Woollard, on behalf of J. B. Martin. (*Consent.*)

Two iron and glass shelters in front of the Waldorf Theatre, Aldwych and Catherine Street, on the further application of Gullow & Co. (*Consent.*)

One-storey shop on the southern side of Gordon House Road, Highgate Road, St. Pancras, westward of the Catholic Apostolic Church, on the application of Tubbs & Messer, on behalf of S. E. Spencer. (*Refusal.*)

Retention of a building at the rear of "Selborne," Leigham Court Road, Wandsworth, at less than the prescribed distance from the centre of the roadway of Leigham Avenue, on the application of W. Lawrance, on behalf of J. Hill. (*Consent.*)

Modification of the provisions of that section with regard to open spaces about buildings, so far as relates to the proposed erection of a building on the north-western side of Bosworth Road, Kensington, between Nos. 10 and 12, with an irregular open space at the rear, on the application of J. W. Chapman, on behalf of the Bosworth Temperance Club, Ltd. (*Consent.*)

Uniting of No. 117, Piccadilly, with the upper floors of a proposed new building to abut upon Down Street, on the application of J. P. Crosby, on behalf of A. McCandlish. (*Consent.*)

Erection of two cooling towers on the south-western side of Burnard Place, Islington, on the application of A. Gay, on behalf of the Islington Metropolitan Borough Council. (*Consent.*)

Construction of a screening and intake chamber, supply and discharge pipes between the River Lea, and the condensers in the generating station, and a discharge chamber at the generating station, Millfields Road, Hackney, on the application of R. Hammond & Son, on behalf of the Hackney Borough Council. (*Consent.*)

Construction of a temporary addition to the generating station, Millbank Street, Westminster, on the application of C. S. Peach, on behalf of the Westminster Electric Supply Corporation. (*Consent.*)

Deviations from the plans approved on 19th December, 1904, for the formation or laying out of new streets for foot traffic only on a site on the west side of Backchurch Lane and east side of Gowers Walk, Whitechapel, so far as relates to an increase in the number of stalls with stores over, the provision of general store rooms for stall holders, the erection of a poultry-killing house with store over, and an extension eastward of the covered entrance from Gower's Walk, on the application of Crickmay & Heath. (*Consent.*)

Deviation from the plans approved on 20th February 1905, for the formation or laying out of a new street for carriage traffic to lead from Trinity Road to Norwood Road, Lambeth, so far as relates to an alteration in the cross section of the proposed street, on the application of C. Deane. (*Consent.*)

New street for foot traffic to lead from Southampton Row, Holborn, to Vernon Place, on the application of R. J. Worley. (*Consent.*)

Extension of Vicarage Gate, Kensington, and in connection therewith the erection of a new parish hall, on the application of Rev. Canon Pennefather. (*Consent.*)

New streets for carriage traffic to lead out of the eastern side of Upper Tulse Hill, Norwood, on the application of Shaw & Lee, on behalf of Messrs. Stringer Brothers. (*Refusal.*)

Retention of two wooden sheds of a temporary character at the premises of the Cheap Wood Co., No. 66, Deptford Green, Greenwich, on the application of the Cheap Wood Co. (*Consent.*)

Wood and glass timekeeper's box in front of the "Myddelton Arms" public-house, Canonbury Road, Islington, as shown, on the application of R. T. Kingham, on behalf of the London General Omnibus Co., Ltd. (*Refusal.*)

New street for carriage traffic in continuation northward of Willow Vale, Uxbridge Road, Hammersmith, on the application of J. H. Richardson, on behalf of Williams & Wallington. (*Consent.*)

Builders' Current Price List of Specialities.

This list is not intended to promote undercutting, and prices are subject to discounts for a quantity and for cash. Readers are advised to write for these discounts. Where prices for goods are standardised and fluctuation takes place in trade discounts, our prices have the discounts deducted. In some cases it is difficult for firms to quote prices, and we have stated where they will be pleased to send catalogues and quotations immediately on receipt of applications.
